Software Engineering For Embedded Systems Chapter 13 Optimizing Embedded Software For Power:

Software Engineering for Embedded Systems Robert Oshana,2013-04-01 One of the most important considerations in the product life cycle of an embedded project is to understand and optimize the power consumption of the device Power consumption is highly visible for hand held devices which require battery power to be able to guarantee certain minimum usage idle times between recharging Other main embedded applications such as medical equipment test measurement media and wireless base stations are very sensitive to power as well due to the need to manage the heat dissipation of increasingly powerful processors power supply cost and energy consumption cost so the fact is that power consumption cannot be overlooked The responsibility for setting and keeping power requirements often falls on the shoulders of hardware designers but the software programmer has the ability to provide a large contribution to power optimization Often the impact that the software engineer has on the power consumption of a device is overlooked or underestimated The goal of this chapter is to discuss how software can be used to optimize power consumption starting with the basics of what power consumption consists of how to properly measure power consumption and then moving on to techniques for minimizing power consumption in software at the algorithmic level hardware level and data flow level This will include demonstrations of the various techniques and explanations of both how and why certain methods are effective at reducing power so the reader can take and apply this work to their application immediately

Software Engineering for Embedded Systems Mike Brogioli,2013-04-01 Optimization metrics for compiled code are not always measured in resulting execution clock cycles on the target architecture Consider a modern cellular telephone or wireless device which may download executables over a wireless network connection or backhaul infrastructure In such cases it is often advantageous for the compiler to reduce the size of the compiled code which must be downloaded to the wireless device By reducing the size of the code needed to be downloaded savings are achieved in terms of bandwidth required for each wireless point of download Optimization metrics such as the memory system performance of compiled code are other metrics which are often important to developers These are metrics correlated to the dynamic run time behavior of not only the compiled code on the target processor but also the underlying memory system caches DRAM and buses etc By efficiently arranging the data within the application or more specifically the order in which data and corresponding data structures are accessed by the application dynamically at run time significant performance improvements can be gained at the memory system level In addition vectorizing compilers can also improve performance due to spatial locality of data when SIMD instruction sets are present and varying memory system alignment conditions are met *Advances in Computer Systems Architecture* ,2005 **ACM SIGPLAN Notices** ,2001-07 **Software Engineering for Embedded Systems** Robert Oshana,2013-04-01 Code optimization is a critical step in the development process as it directly impacts the ability of the system to do its intended job Code that executes faster means more channels more work performed and competitive

advantage Code that executes in less memory enables more application features to fit into the cell phone Code that executes with less overall power consumption increases battery life or reduces money spent on powering a base station This chapter is intended to help programmers write the most efficient code possible whether that is measured in processor cycles memory or power It starts with an introduction to using the tool chain covers the importance of knowing the embedded architecture before optimization then moves on to cover a wide range of optimization techniques Techniques are presented which are valid on all programmable architectures C language optimization techniques and general loop transformations Real world examples are presented throughout Proceedings of ASP-DAC/VLSI Design 2002 ,2002 Papers from a January 2002 conference are organized into four sessions each on low power design synthesis testing layout and interconnects and technology as well as two sessions each on embedded systems verification and VLSI architecture one session on analog design and one session on hot c Electrical & Electronics Abstracts ,1997 **CASES ...** ,2005 Who's Who in Finance and Business Marquis Who's Who, LLC,National Register Publishing,2005-12 **Bulletin of the Institution of Engineers (India)**.
