

HOW CAMERAS WORK | In 3 Simple Steps

Step 1: Aperture

The aperture refers to the diameter of the hole inside the lens. A change in aperture alters the size of this hole, allowing more or less light into the camera which also has an effect on the depth of field of your final image.

Step 2: Shutter Speed

The mirror flips up and the shutter opens, recording the light present onto the sensor (or film). The speed at which this happens determines the exposure length as well as the amount of motion blur.

Step 3: ISO

The sensor captures the light and is controlled by the ISO. The higher you set the ISO, the more sensitive this will be but it'll also capture more digital noise.

100 200 400 800 1600 3200 6400

Low ISO =
Less Sensitive, Less Noise

High ISO =
More Sensitive, More Noise
