

3. Wound Closure Codes

Introduction: Wound closure is a crucial step in wound care that involves bringing the edges of a wound together and securing them to promote healing and minimize the risk of infection. Wound closure codes are used to report the procedures performed to close wounds, such as suturing, stapling, or adhesive application. Wound preparation codes include 12001, 12002, 12004, 12031, and 12032.

Clinical example: A patient sustains a laceration on their forearm while cooking and visits the emergency department. The physician cleans the wound thoroughly, assesses its length, depth, and tissue involvement, and decides to close it using sutures. After measuring the wound, the physician determines that it falls within the range of 2.6 cm to 7.5 cm. Consequently, CPT code 12002, which represents the simple repair of superficial wounds in this size range, is selected to report the closure procedure.

Common mistakes:

- **Incorrect code selection:** Ensure accurate measurement and classification of wound sizes to select the appropriate code. Choosing a code that does not align with the wound's characteristics can lead to incorrect reimbursement.
