The Chaos Numbers Series 2:

Proceedings ,2003 Nonlinear Dynamics in the Life and Social Sciences William H. Sulis,Irina Nikolaevna Trofimova,2001 Incorporating chaos theory into psychology and the life sciences this text includes empirical studies of neural encoding memory eye movements warfare business cycles and selection of time series analysis algorithms There are theoretical chapters on emergence and social dynamics and clinical contributions dealing with the measurement of quality of life for psychiatric patients psychosis the organization of self and the role of love in family dynamics Finally ideas from non linear dynamics are applied to understanding the creative process Economic Dynamics Ronald Shone,2002-11-28 This is the substantially revised and restructured second edition of Ron Shone s successful advanced textbook Economic Dynamics The book provides detailed coverage of dynamics and phase diagrams including quantitative and qualitative dynamic systems continuous and discrete dynamics linear and non linear systems and single equation and systems of equations It illustrates dynamic systems using Mathematica Maple V and spreadsheets It provides a thorough introduction to phase diagrams and their economic application and explains the nature of saddle path solutions The second edition contains a new chapter on oligopoly and an extended treatment of stability of discrete dynamic systems and the solving of first order difference equations Detailed routines on the use of Mathematica and Maple are now contained in the body of the text which now includes advice on the use of Excel and additional examples and exercises throughout Supporting website contains solutions manual and learning tools **New Trends on System Science and Engineering** H. Fujita,S.-F. Su,2015-06-23 System science and engineering is a field that covers a wide spectrum of modern technology A system can be seen as a collection of entities and their interrelationships which forms a whole greater than the sum of the entities and interacts with people organisations cultures and activities and the interrelationships among them Systems composed of autonomous subsystems are not new but the increased complexity of modern technology demands ever more reliable intelligent robust and adaptable systems to meet evolving needs This book presents papers delivered at the International Conference on System Science and Engineering ICSSE2015 held in Morioka Japan in July 2015 Some of the topics covered here include systems modeling tools and simulation cloud robotics and computing systems systems safety and security smart grid human systems and industrial organization and management and novel applications of systems engineering and systems architecture Capturing as it does the latest state of the art and challenges in system sciences and its supporting technology this book will be of interest to all those involved in developing and using system science methodology tools and techniques Modeling Disease Spread and Control Tariq Halasa,Salome Dürr,2018-01-18 Mathematical models are useful tools to understand the epidemiology and agent host interaction of diseases They are developed and applied since over a century but with increasing computer capacity they become increasingly prominent as part of evidence based decision making Mathematical models are frequently used to construct preparedness and contingency plans for highly contagious diseases such as foot and mouth disease This

allows proposing effective strategies to control the spread of the disease in case of an incursion and avails useful tools to support decision making during an outbreak. They are also used to monitor, prevent and control endemic diseases within populations or farms. In addition, mathematical models improve our understanding of the contact structure between farms, pointing out risky elements in the contact network for disease introduction or further spread within the population. This Research Topic presents valuable studies presenting different aspects and implementations of mathematical modeling for disease spread and control in the veterinary field. The areas covered include model construction, network analysis, tools for decision makers and cost-effective control of endemic diseases.
