

ACCEPTABLE**UNACCEPTABLE**

20.4 Small cracks in the underside of a V-ribbed belt are acceptable - lengthwise cracks, or missing pieces that cause the belt to make noise, and cause for replacement

4. Inspect the fittings at both ends of the filter to see if they're clean. If more than a light coating of dust is present, clean the fittings before proceeding.
5. Release the clips holding the fuel lines to the filter (see Chapter 4, Section 4).
6. Detach the fuel hoses, one at a time, from the filter. Be prepared for fuel spillage.
7. After the lines are detached, check the fittings for damage and distortion. If they were damaged in any way during removal, new ones must be used when the lines are reattached to the new filter (if new clips are packaged with the filter, be sure to use them in place of the originals).
8. Remove the fuel filter from the mounting bracket, while noting the direction the fuel filter is installed.
9. Install the new filter in the same direction. Carefully push each hose onto the filter until it's seated against the collar on the fitting, then install the clips (see Chapter 4, Section 4). Make sure the clips are securely attached to the hose fittings - if they come off, the hoses could back off the filter and a fire could result!
10. Start the engine and check for fuel leaks.

25 Brake fluid change (every 30,000 miles or 24 months)

Warning: Brake fluid can burn your eyes and damage painted surfaces, so use extreme caution when handling or pouring it. Do not use brake fluid that has been standing open or is more than one year old. Brake fluid absorbs moisture from the air. Excess moisture can cause a dangerous loss of braking effectiveness.

1. At the specified intervals, the brake fluid should be drained and replaced. Since the brake fluid may drip or splash when pouring it,

place plenty of rags around the master cylinder to protect any surrounding painted surfaces.

2. Before beginning work, purchase the specified brake fluid (see Recommended Substances and fluids in this Chapter's Specifications).
3. Remove the cap from the master cylinder reservoir.
4. Using a hand suction pump or similar device, withdraw the fluid from the master cylinder reservoir.
5. Add new fluid to the master cylinder until it rises to the base of the filler neck.
6. Bleed the brake system as described in Chapter 9 at all four brakes until new and uncontaminated fluid is expelled from the bleeder screw. Be sure to maintain the fluid level in the master cylinder as you perform the bleeding process. If you allow the master cylinder to run dry, air will enter the system.
7. Refill the master cylinder with fluid and check the operation of the brakes. The pedal should feel solid when depressed, with no sponginess. **Warning:** Do not operate the vehicle if you are in doubt about the effectiveness of the brake system.

26 Drivebelt check and replacement (every 30,000 miles or 24 months)

1. A single serpentine drivebelt is located at the front of the engine and plays an important role in the overall operation of the engine and its components. Due to its function and material make up, the belt is prone to wear and should be periodically inspected. Although the belt should be inspected at the recommended intervals, replacement may not be necessary for more than 100,000 miles.
2. The vehicles covered by this manual are

20.5 Belt wear indicator marks are located on the side of the tensioner body - when the belt reaches the maximum wear mark it must be replaced (3.4L engine shown)

- A. Maximum length (belt worn out when indicator reaches this point)
- B. Belt length indicator

equipped with a single self-adjusting serpentine drivebelt, which is used to drive all of the accessory components such as the alternator, power steering pump, water pump and air conditioning compressor.

Check

Refer to Illustrations 20.4 and 20.5

3. With the engine off, open the hood and locate the drivebelt at the front of the engine. Using your fingers (and a flashlight, if necessary), move along the belts checking for cracks and separation of the belt plies. Also check for fraying and glazing, which gives the belt a shiny appearance. Both sides of each belt should be inspected, which means you will have to turn the belt to check the underside.
4. Check the ribs on the underside of the belt. They should all be the same depth, with none of the surface uneven (see Illustration 20.4).
5. The tension of the belt is automatically adjusted by the belt tensioner and does not require any adjustments. Drivebelt wear can be checked visually by inspecting the wear indicator marks located on the side of the tensioner body. Locate the belt tensioner at the front of the engine, adjacent to the lower crankshaft pulley; then find the tensioner operating marks. If the indicator mark is outside the operating range, the belt should be replaced (see Illustrations).

Replacement

Refer to Illustrations 20.6 and 20.8

6. To replace the belt, rotate the tensioner counterclockwise on V6 models, or clockwise on V8 models to relieve the tension on the belt (see Illustrations).
7. Remove the belt from the auxiliary components.
