## **Test Ingegneria Catania:**

Tests and Proofs Catherine Dubois, 2009-06-29 1 This volume contains the research papers and invited papers presented at the Third International Conference on Tests and Proofs TAP 2009 held at ETH Zurich Switzerland during July 2 3 2009 The TAP conference is devoted to the convergence of proofs and tests It combines ideas from both sides for the advancement of software quality To prove the correctness of a program is to demonstrate through impeccable mathematical techniques that it has no bugs to test a program is to run it with the expectation of discovering bugs The two techniques seem contradictory if you have proved your program it is fruitless to comb it for bugs and if you are testing it that is surely a sign that you have given up on any hope of proving its correctness Accordingly proofs and tests have since the onset of software engineering research been pursued by distinct communities using rather different techniques and tools And yet the development of both approaches leads to the discovery of common issues and to the realization that each may need the other The emergence of model checking has been one of the first signs that contradiction may yield to complementarity but in the past few years an increasing number of research efforts have encountered the need for combining proofs and tests dropping earlier dogmatic views of incompatibility and taking instead the best of what each of these software engineering domains has to offer

*Proceedings*, 1990 *Dynamical Systems, Wave-Based Computation and Neuro-Inspired Robots* Paolo Arena, 2008-11-30 This volume is a special Issue on Dynamical Systems Wave based computation and neuro inspired robots based on a Course

carried out at the CISM in Udine Italy the last week of September 2003 From the topics treated within that Course several new ideas were formulated which led to a new kind of approach to locomotion and perception grounded both on biologically inspired issues and on nonlinear dynamics The Course was characterised by a high degree of multi disciplinarity In fact in order to conceive design and build neuro inspired machines it is necessary to deeply scan into different disciplines including neuroscience Artificial Intelligence Biorobotics Dynamical Systems theory and Electronics New types of moving machines should be more closely related to the biological rules not discarding the real implementation issues The recipe has to include neurobiological paradigms as well as behavioral aspects from the one hand new circuit paradigms able of real time control of multi joint robots on the other hand These new circuit paradigms are based on the theory of complex nonlinear dynamical systems where aggregates of simple non linear units into ensembles of lattices have the property that the solution set is much richer than that one shown by the single units As a consequence new solutions emerge which are often characterized by order and harmony
