Interfaces and Visual Analytics for Visualizing Spatio-temporal Data with Micromaps Chunling Zhang,2012 This dissertation addresses the visualization of spatio temporal data for the purposes of communication understanding discovery and analysis A common approach to spatio temporal visualization seeks to convey changes by showing a sequence of maps over time that does not address the problem of change blindness The dissertation builds upon and extends the work of Carr and Pickle 2010 that calls attention to this problem and addresses visualization of spatial data patterns with conditioned and comparative micromaps The dissertation adds dynamic interactivity to the comparative maps that address change blindness develops new designs and demonstrates their use Examples use the resulting interactive visualization tool named TCmaps Temporal Change maps to illustrate the designs and general utility by showing data from a variety of domains including health education environment demography and ecology The examples show

that one can see point at and talk about all the changes designated by interactive thresholds since the changes are shown explicitly in separate maps sequences The interactive designs address additional issues such as setting thresholds for categories whose changes are to be observed and methods for viewing change map sequences that are too long to see in one view TCmaps is a general visual analytical tool The dissertation emphasizes displaying results for two kinds of simulation models One is a computational fluid dynamics model that simulates the transport and dispersion of toxic releases The second shows the application of TCmaps to understanding the spread of an invasive species the Eurasian Collared Dove ECD in the United States In the last two decades researchers have developed many spatio temporal models to characterize the invasion of ECD This research modifies the hierarchical Bayesian matrix model developed by Hooten et al 2006a to provide new simulation results that better account for the species mysterious northwestern expansion In this case study TCmaps provides a powerful platform to display the spatial context of bird survey routes observations estimates forecasts and variances Since the research and methodology development in this dissertation builds on advances in the cognitive data statistics and computing sciences the results are of potential interest for a large domain of application

Graphics of Large Datasets Antony

Unwin, Martin Theus, Heike Hofmann, 2006-07-24 This book shows how to look at ways of visualizing large datasets whether large in numbers of cases or large in numbers of variables or large in both. All ideas are illustrated with displays from analyses of real datasets and the importance of interpreting displays effectively is emphasized. Graphics should be drawn to convey information and the book includes many insightful examples. New approaches to graphics are needed to visualize the information in large datasets and most of the innovations described in this book are developments of standard graphics. The book is accessible to readers with some experience of drawing statistical graphics.

Visualizing Data Ben Fry, 2007-12-18
Enormous quantities of data go unused or underused today simply because people can't visualize the quantities and relationships in it. Using a downloadable programming environment developed by the author, *Visualizing Data* demonstrates methods for representing data accurately on the Web and elsewhere, complete with user interaction, animation and more. How do the 3.1 billion A, C, G and T letters of the human genome compare to those of a chimp or a mouse? What do the paths that millions of visitors take through a web site look like? With *Visualizing Data*, you learn how to answer complex questions like these with thoroughly interactive displays. We're not talking about cookie cutter charts and graphs. This book teaches you how to design entire interfaces around large, complex data sets with the help of a powerful new design and prototyping tool called Processing. Used by many researchers and companies to convey specific data in a clear and understandable manner, the Processing beta is available free. With this tool and *Visualizing Data* as a guide, you'll learn basic visualization principles, how to choose the right kind of display for your purposes and how to provide interactive features that will bring users to your site over and over. This book teaches you the seven stages of visualizing data: acquire, parse, filter, mine, represent, refine and interact. How all data problems begin with a question and end with a narrative construct that provides a clear answer without extraneous details. Several example projects with the code to make them work. Positive and negative points of each representation discussed. The focus is on customization so that each one best suits what you want to convey about your data set. The book does not provide ready made visualizations that can be plugged into any data set. Instead, with chapters divided by types of data rather than types of display, you'll learn how each visualization conveys the unique properties of the data it represents, why the data was collected, what's interesting about it and what stories it can tell. *Visualizing Data* teaches you how to answer questions, not simply display information.

Visualize This is a guide on how to visualize and tell stories with data, providing practical design tips complemented with step-by-step tutorials. It begins with a description of the huge growth of data and visualization in industry, news, and government, and opportunities for those who tell stories with data. Logically, it moves on to actual stories in data, statistical ones with trends and human stories; the technical part comes up quickly with how to gather, parse, and format data with Python, R, Excel, Google Docs, etc., and details tools to visualize data native graphics for the Web like ActionScript, Flash libraries, PHP, JavaScript, CSS, HTML. Every chapter provides an example as well. Patterns over time and kinds of data charts.

are followed by proportions chart types and examples Next examples and descriptions of outliers and how to show them different kinds of maps how to guide your readers and explain the data in the visualization The book ends with a value add appendix on graphical perception Data Points focuses on the approach to visualization and data Visualization is a medium that can be used as a tool art a way to tell stories etc Data Points guides readers through making data approachable through visualization techniques and best practices The focus is on designing with a purpose in mind Data Points discusses why recipes from the rules work and expands on how readers can make their own recipes The book is example driven featuring work from people in areas of art design business statistics computer science cartography and online media as well as many of the author s own illustrations The major sections of the book cover Visualization as Medium In the same way not all movies are documentaries not all visualization is about optimal visual perception Data Representation There are rules across all visualization applications such as the use of appropriate shapes to accurately represent values Design with Purpose Rules can be broken though It all depends on who and what you re designing for Data Points digs deep into the foundations of data visualization Understanding Data and Visualization Representing Data Exploring Data Visually Designing for an Audience Visualizing with Clarity Putting Everything Into Practice with Tools and Resources

Post,Gregory M. Nielson,Georges-Pierre Bonneau,2012-12-06 Data visualization is currently a very active and vital area of research teaching and development The term unites the established field of scientific visualization and the more recent field of information visualization The success of data visualization is due to the soundness of the basic idea behind it the use of computer generated images to gain insight and knowledge from data and its inherent patterns and relationships A second premise is the utilization of the broad bandwidth of the human sensory system in steering and interpreting complex processes and simulations involving data sets from diverse scientific disciplines and large collections of abstract data from many sources These concepts are extremely important and have a profound and widespread impact on the methodology of computational science and engineering as well as on management and administration The interplay between various

application areas and their specific problem solving visualization techniques is emphasized in this book Reflecting the heterogeneous structure of Data Visualization emphasis was placed on these topics Visualization Algorithms and Techniques Volume Visualization Information Visualization Multiresolution Techniques Interactive Data Exploration Data Visualization The State of the Art presents the state of the art in scientific and information visualization techniques by experts in this field It can serve as an overview for the inquiring scientist and as a basic foundation for developers This edited volume contains chapters dedicated to surveys of specific topics and a great deal of original work not previously published illustrated by examples from a wealth of applications The book will also provide basic material for teaching the state of the art techniques in data visualization Data Visualization The State of the Art is designed to meet the needs of practitioners and researchers in scientific and information visualization This book is also suitable as a secondary text for graduate level students in computer science and engineering
