and Technical Overview Scott Vetter,Alexandre Bicas Caldeira,Volker Haug,IBM Redbooks,2017-09-28 This IBM Redpaper™ publication is a comprehensive guide that covers the IBM Power System™ S822LC for High Performance Computing HPC server 8335 GTB model The S822LC for HPC server is designed for high performance computing applications that support the Linux operating system and high performance data analytics the enterprise data center and accelerated cloud deployments This paper introduces the major innovative S822LC for HPC server features and their relevant functions Powerful IBM POWER8 processors that offer 16 cores at 3 259 GHz with 3 857 GHz turbo performance or 20 cores at 2 860 GHz with 3 492 GHz turbo A 19 inch rack mount 2U configuration NVIDIA NVLink technology for exceptional processor to accelerator intercommunication Four dedicated connectors for the NVIDIA Tesla P100 GPU This publication is for professionals who want to acquire a better understanding of IBM Power Systems products and is intended for the following audience Clients Sales and marketing professionals Technical support professionals IBM Business Partners Independent software vendors This paper expands the set of IBM Power Systems documentation by providing a desktop reference that offers a detailed technical description of the S822LC for HPC server This paper does not replace the latest marketing materials and configuration tools It is intended as an additional source of information that together with existing sources can be used to enhance your knowledge of IBM server solutions [GPU-accelerated High-performance Computing for Architecture-aware Wave Simulation Based on Discontinuous Galerkin Algorithms](#) Bagus Hanindhito,2020 Full waveform inversion has been an essential method for oil and gas industries to approximate the properties of the Earth s surface without the need to see them directly by digging drilling or tunneling and thus lowering exploration costs This method relies on the use of generated seismic waves and the acquisition of the reflected wave data Since each type of rocks sediments and materials have different properties the acquired data can be used to approximate the location of mineral and oil repository for example The first problem which is the focus of this research is called the forward problem which aims to generate

synthetic seismograms based on the given model The second problem is the inverse problem which tries to find the optimum model that can best describe the obtained data Generally the area of the seismic survey is massive and can easily generate a vast amount of data which is used to find the best Earth model Therefore a considerable amount of computing power is required to help in solving these problems Industrial scale wave simulators typically use multiple CPUs to accelerate computation As the size of the problem increases the time needed to run the simulation will increase accordingly In this thesis we investigated the implementation of a CPU based wave simulator to find available parallelism that can be extracted We mapped the massive number of parallelism to GPU which has thousands of cores and thus suitable for doing this job We performed additional optimization of the basic code to improve the performance We also developed a method to verify the functionality of our implementation against the original code The GPU accelerated version of the code is then compared to the original CPU code We run the simulation for different levels of discretization both in consumer class GPU and datacenter class GPU For the double precision run our benchmark results show the speed up over 120x 210x and 330x in GeForce GTX 1080Ti Tesla P100 and Tesla V100 GPU respectively compared to the dual Intel Xeon Platinum 8160 CPUs with a total of 48 cores
