**Numerical Modeling of Supercontinuum Generation in Optical Fibers** François St-Hilaire, 2020 This thesis reports the comparison of numerical modeling approaches for the extreme case of pulse propagation in optical fibers leading to supercontinuum generation. The widely used generalized nonlinear Schrödinger equation is introduced along with two other propagation models: the Fourier domain generalized Schrödinger equation and the nonlinear envelope equation, which are physically more accurate and retain the same first order differential equation formalism. The performance of the three propagation models is investigated with simulations of different experimental results from the literature. The numerical results show that the Fourier domain generalized Schrödinger equation and the nonlinear envelope equation are useful tools in specific cases and that the generalized nonlinear Schrödinger equation is nonetheless sufficiently accurate to model supercontinuum generation in a wide range of experimental conditions. This is subsequently corroborated in a practical example of supercontinuum source prototype optimization aided with numerical simulations.
