Kim, Luigi Romano, Stefano Russo, 2004 **Using Aspect-oriented Programming to Enforce Architecture** Paulo Merson, 2007 Abstract Using aspect oriented programming AOP software developers can define customized compile time error or warning messages that are issued when the code contains join points that match specified pointcuts These customized messages are generated by compile time declarations which are an extremely simple but powerful AOP mechanism Declarations that look for nonvalid interactions between modules can be used for architecture enforcement Coding policies best practices design patterns and code naming conventions can also be enforced Compile time declarations operate as an additional verification in the build process but they do not affect the compiled application and can be turned on

and off at any time That feature makes this approach an automated and nondisruptive solution for architecture enforcement and a risk free first step towards AOP adoption

Aspect-oriented C (ACC) Weigang Gong,2007 Aspect oriented software development AOSD is an emerging software engineering methodology helping modularize crosscutting concerns which are difficult to be cleanly modularized by traditional programming models like object oriented OO or procedural programming Its programming model is called aspect oriented programming AOP Though AOSD has been shown to improve the modularity of software systems when combined with OO languages like Java or C it is still questionable whether it could help C create software systems with high modularity One reason for relatively slow adoption of AOP in C is lacking tool support Without stable and powerful tools researchers could not incorporate AOP into C In order to provide a good tool ASPECT ORIENTED C ACC was developed It implements most well known AOP features and introduces some new features This thesis describes the A SPECT ORIENTED C language specification the ACC compiler and several case studies on industry scale C projects using ACC
