Atmospheric Science John M. Wallace, Peter V. Hobbs, 2006-03-24 Atmospheric Science Second Edition is the long awaited update of the classic atmospheric science text which helped define the field nearly 30 years ago and has served as the cornerstone for most university curricula. Now students and professionals alike can use this updated classic to understand atmospheric phenomena in the context of the latest discoveries and prepare themselves for more advanced study and real life problem solving. This latest edition of Atmospheric Science has been revamped in terms of content and appearance. It contains new chapters on atmospheric chemistry, the Earth system, the atmospheric boundary layer and climate, as well as enhanced treatment of atmospheric dynamics, radiative transfer, severe storms and global warming. The authors illustrate concepts with full color state of the art imagery and cover a vast amount of new information in the field. Extensive numerical and qualitative exercises help students apply basic physical principles to atmospheric problems. There are also biographical footnotes summarizing the work of key scientists along with a student companion website that hosts climate data, answers to quantitative exercises, full solutions to selected exercises, skew T log p chart related links, appendices and more. The instructor website features instructor's guide solutions to quantitative exercises, electronic figures from the book, plus supplementary images for use in classroom presentations. Meteorology students at both advanced undergraduate and graduate levels will find this book extremely useful. Full color satellite imagery and cloud photographs illustrate principles throughout. Extensive numerical and qualitative exercises emphasize the application of basic physical principles to problems in the atmospheric sciences. Biographical footnotes summarize the lives and work of scientists mentioned in the text and provide students with a sense of the long history of meteorology. Companion website encourages more advanced exploration of text topics, supplementary information, images and bonus exercises.

The lectures are written in modular form, i.e. they can be used at the undergraduate level for classes covered by the chapters or at the graduate level as a comprehensive intensive course. The student/instructor can address chapters 2 (thermodynamics) and 4 (radiation) in any order. They can also switch the order of chapter 5 (chemistry) and 6 (dynamics). Chapter 7 (climatology and climate) requires an

understanding of all chapters Chapter 3 cloud physics needs basics from chapter 2 to understand the cloud microphysical processes The governing conservation equations for trace constituents dry air water substances total mass energy entropy and momentum are presented including simplifications and their application in models A brief introduction to atmospheric boundary layer processes is presented as well Basic principles of climatology discussed include analysis methods atmospheric waves and their analytical solutions tropical and extra tropical cyclones classical and non classical mesoscale circulations and the global circulation The atmospheric chemistry section encompasses photolytic and gas phase processes aqueous chemistry aerosol processes fundamentals of biogeochemical cycles and the ozone layer Solar and terrestrial radiation major absorber radiation balance radiative equilibrium radiative convective equilibrium and basics of molecular aerosol and cloud adsorption and scattering and their use in remote sensing are also presented
