

Intelligence tests – Binet Kamath Test

INTRODUCTION

The term intelligence is a very popular term used widely to mean many things – quick understanding, fast learning, accuracy in learning, clever thinking, quick doing etc. The term intelligence comes from a Latin word coined by Cicero to translate a Greek word used to cover all cognitive processes. Intelligence is the capacity to acquire knowledge and to learn things. Intelligence is the innate capacity which facilitates effective dealing with environment. One of the popular and recent definitions is that of Wechsler, “It is the aggregate or global capacity of the individual to act purposefully, to think rationally and to deal effectively with the environment.” Intelligence grows or increases up to 16 years in a normal individual. The growth of intelligence is influenced to great extent by biochemical, cultural and hereditary factor. The work on intelligence was started by Binet in 1896 in collaboration with Simon. His first scale known as Binet Simon scale published in 1905 consisted of 30 items in order of increasing difficulty. This was further revised by Binet in 1908. Stanford University revised and improved in 1916 and 1937 and latest revision was brought in 1960. As the test scores do not give a clear picture of a previous intelligence, Binet introduced the concept of M.A. The MA or the mental age of an individual can be expressed in terms of its CA to which the psychological functions belong. William Stern went ahead and introduced the concept of I.Q. It is the ratio of MA and CA and the product is multiplied by 100 to avoid the small fractions.
