Pattern Recognition DAGM (Organization). Symposium, 2001 **Proceedings**, 2005 **Multi-scale 3D Scene Flow from Binocular Stereo Sequences (Preprint)**. , 2007 Scene flow methods estimate the three dimensional motion field for points in the world using multi camera video data Such methods combine multi view reconstruction with motion estimation This paper describes an alternative formulation for dense scene flow estimation that provides reliable results using only two cameras by fusing stereo and optical flow estimation into a single coherent framework Internally the proposed algorithm generates probability distributions for optical flow and disparity Taking into account the uncertainty in the intermediate stages allows for more reliable estimation of the 3D scene flow than previous methods allow To handle the aperture problems inherent in the estimation of optical flow and disparity a multi scale method along with a novel region based technique is used within a regularized solution This combined approach both preserves discontinuities and prevents over regularization to problems commonly associated with the basic multi scale approaches Experiments with synthetic and real test data demonstrate the strength of the proposed approach

3D Dynamic Scene Analysis Zhengyou Zhang, Olivier Faugeras, 2012-12-06 the problem of analyzing sequences of images to extract three dimensional T motion and structure has been at the heart of the research in computer vision for many years It is very important since its success or failure will determine whether or not vision can be used as a sensory process in reactive systems The considerable research interest in this field has been motivated at least by the following two points 1 The redundancy of information contained in time varying images can overcome several difficulties encountered in interpreting a single image 2 There are a lot of important applications including automatic vehicle driving traffic control aerial surveillance medical inspection and global model construction However there are many new problems which should be solved how to efficiently process the abundant information contained in time varying images how to model the change between images how to model the uncertainty inherently associated with the imaging system and how to solve inverse problems which are generally ill posed There are of course many possibilities for attacking these problems and many more remain to be explored We discuss a few of them in this book based on work carried out during the last five years in the Computer Vision and Robotics Group at INRIA Institut National de Recherche en Informatique et en Automatique
