Stochastic Algorithms For Visual Tracking:

Stochastic Algorithms for Visual Tracking John MacCormick, 2012-12-06 A central problem in computer vision is to track objects as they move and deform in a video sequence Stochastic algorithms in particular particle filters and the Condensation algorithm have dramatically enhanced the state of the art for such visual tracking problems in recent years This book presents a unified framework for visual tracking using particle filters including the new technique of partitioned sampling which can alleviate the curse of dimensionality suffered by standard particle filters The book also introduces the notion of contour likelihood a collection of models for assessing object shape colour and motion which are derived from the statistical properties of image features Because of their statistical nature contour likelihoods are ideal for use in stochastic algorithms A unifying theme of the book is the use of statistics and probability which enable the final output of the algorithms presented to be interpreted as the computer's belief about the state of the world The book will be of use and interest to students researchers and practitioners in computer vision and assumes only an elementary knowledge of probability theory

Unconstrained Face Recognition Shaohua Kevin Zhou,Rama Chellappa,Wenyi Zhao,2006-10-11 Face recognition has been actively studied over the past decade and continues to be a big research challenge Just recently researchers have begun to investigate face recognition under unconstrained conditions *Unconstrained Face Recognition* provides a comprehensive review of this biometric especially face recognition from video assembling a collection of novel approaches that are able to recognize human faces under various unconstrained situations The underlying basis of these approaches is that unlike conventional face recognition algorithms they exploit the inherent characteristics of the unconstrained situation and thus improve the recognition performance when compared with conventional algorithms

Unconstrained Face Recognition is structured to meet the needs of a professional audience of researchers and practitioners in industry This volume is also suitable for advanced level students in computer science

Computer Vision Research Progress Zhongkai Zhu, 2008 Computer vision is the science and technology of machines that see As a scientific discipline computer vision is concerned with the theory and technology for building artificial systems that obtain information from images The image data can take many forms such as a video sequence views from multiple cameras or multi dimensional data from a medical scanner As a technological discipline computer vision seeks to apply the theories and models of computer vision to the construction of computer vision systems Examples of applications of computer vision systems include systems for controlling processes e g an industrial robot or an autonomous vehicle Detecting events e g for visual surveillance Organizing information e g for indexing databases of images and image sequences Modeling objects or environments e g industrial inspection medical image analysis or topographical modeling Interaction e g as the input to a device for computer human interaction Computer vision can also be described as a complement but not necessarily the opposite of biological vision In biological vision the visual perception of humans and various animals are studied resulting in models of how these systems operate in terms of physiological processes Computer vision on the other hand studies and describes artificial vision system that are implemented in software and or hardware Interdisciplinary exchange between biological and computer vision has proven increasingly fruitful for both fields Sub domains of computer vision include scene reconstruction event detection tracking object recognition learning indexing ego motion and image restoration This new book presents leading edge new research from around the world
