Computing Satyadhyana Chickerur,2019-03-13 This edited book aims to present the state of the art in research and

development of the convergence of high performance computing and parallel programming for various engineering and scientific applications. The book has consolidated algorithms, techniques, and methodologies to bridge the gap between the theoretical foundations of academia and implementation for research which might be used in business and other real time applications in the future. The book outlines techniques and tools used for emergent areas and domains which include acceleration of large scale electronic structure simulations with heterogeneous parallel computing, characterizing power and energy efficiency of a data centric high performance computing runtime and applications security, applications of GPUs, parallel implementation of multiprocessors on MPI using FDTD, particle based fused rendering, design and implementation of particle systems for mesh free methods with high performance and evolving topics on heterogeneous computing. In the coming days the need to converge HPC, IoT, cloud based applications will be felt and this volume tries to bridge that gap.

□ 2019-02-01 AI 16 AI TensorFlow AI **IBM Power System S822LC for High Performance Computing Introduction and Technical Overview** Scott Vetter, Alexandre Bicas Caldeira, Volker Haug, IBM Redbooks, 2017-09-28 This IBM Redpaper™ publication is a comprehensive guide that covers the IBM Power System™ S822LC for High Performance Computing HPC server 8335 GTB model. GPU-accelerated High-performance Computing for Architecture-aware Wave Simulation Based on Discontinuous Galerkin Algorithms Bagus Hanindhito, 2020 Full waveform inversion has been an essential method for oil and gas industries to approximate the properties of the Earth's surface without the need to see them directly by digging, drilling or tunneling and thus lowering exploration costs. This method relies on the use of generated seismic waves and the acquisition of the reflected wave data. Since each type of rocks, sediments, and materials have different properties, the acquired data can be used to approximate the location of mineral and oil repository for example. The first problem which is

the focus of this research is called the forward problem which aims to generate synthetic seismograms based on the given model The second problem is the inverse problem which tries to find the optimum model that can best describe the obtained data Generally the area of the seismic survey is massive and can easily generate a vast amount of data which is used to find the best Earth model Therefore a considerable amount of computing power is required to help in solving these problems Industrial scale wave simulators typically use multiple CPUs to accelerate computation As the size of the problem increases the time needed to run the simulation will increase accordingly In this thesis we investigated the implementation of a CPU based wave simulator to find available parallelism that can be extracted We mapped the massive number of parallelism to GPU which has thousands of cores and thus suitable for doing this job We performed additional optimization of the basic code to improve the performance We also developed a method to verify the functionality of our implementation against the original code The GPU accelerated version of the code is then compared to the original CPU code We run the simulation for different levels of discretization both in consumer class GPU and datacenter class GPU For the double precision run our benchmark results show the speed up over 120x 210x and 330x in GeForce GTX 1080Ti Tesla P100 and Tesla V100 GPU respectively compared to the dual Intel Xeon Platinum 8160 CPUs with a total of 48 cores
