Text Mining Text Mining:

Text Mining Sholom M. Weiss, Nitin Indurkha, Tong Zhang, Fred Damerau, 2010-01-08 Data mining is a mature technology. The prediction problem looking for predictive patterns in data has been widely studied. Strong methods are available to the practitioner. These methods process structured numerical information where uniform measurements are taken over a sample of data. Text is often described as unstructured information. So it would seem text and numerical data are different, requiring different methods. Or are they? In our view a prediction problem can be solved by the same methods whether the data are structured numerical measurements or unstructured text. Text and documents can be transformed into measured values such as the presence or absence of words and the same methods that have proven successful for predictive data mining can be applied to text. Yet there are key differences. Evaluation techniques must be adapted to the chronological order of publication and to alternative measures of error. Because the data are documents more specialized analytical methods may be preferred for text. Moreover the methods must be modified to accommodate very high dimensions tens of thousands of words and documents. Still the central themes are similar.

[Mining Text Data](#) Charu C. Aggarwal, ChengXiang Zhai, 2012-02-03 Text mining applications have experienced tremendous advances because of web 2.0 and social networking applications. Recent advances in hardware and software technology have led to a number of unique scenarios where text mining algorithms are learned. *Mining Text Data* introduces an important niche in the text analytics field and is an edited volume contributed by leading international researchers and practitioners focused on social networks data mining. This book contains a wide swath in topics across social networks data mining. Each chapter contains a comprehensive survey including the key research content on the topic and the future directions of research in the field. There is a special focus on Text Embedded with Heterogeneous and Multimedia Data which makes the mining process much more challenging. A number of methods have been designed such as transfer learning and cross lingual mining for such cases. *Mining Text Data* simplifies the content so that advanced level students, practitioners and researchers in computer science can benefit from this book. Academic and corporate libraries as well as ACM, IEEE and Management Science focused on information security, electronic commerce, databases, data mining, machine learning and statistics are the primary buyers for this reference book.

articles scientific literature emails enterprise documents and social media such as blog articles forum posts product reviews and tweets. This has led to an increasing demand for powerful software tools to help people analyze and manage vast amounts of text data effectively and efficiently. Unlike data generated by a computer system or sensors text data are usually generated directly by humans and are accompanied by semantically rich content. As such text data are especially valuable for discovering knowledge about human opinions and preferences in addition to many other kinds of knowledge that we encode in text. In contrast to structured data which conform to well defined schemas thus are relatively easy for computers to handle text has less explicit structure requiring computer processing toward understanding of the content encoded in text. The current technology of natural language processing has not yet reached a point to enable a computer to precisely understand natural language text but a wide range of statistical and heuristic approaches to analysis and management of text data have been developed over the past few decades. They are usually very robust and can be applied to analyze and manage text data in any natural language and about any topic. This book provides a systematic introduction to all these approaches with an emphasis on covering the most useful knowledge and skills required to build a variety of practically useful text information systems. The focus is on text mining applications that can help users analyze patterns in text data to extract and reveal useful knowledge. Information retrieval systems including search engines and recommender systems are also covered as supporting technology for text mining applications. The book covers the major concepts techniques and ideas in text data mining and information retrieval from a practical viewpoint and includes many hands on exercises designed with a companion software toolkit i.e. MeTA to help readers learn how to apply techniques of text mining and information retrieval to real world text data and how to experiment with and improve some of the algorithms for interesting application tasks. The book can be used as a textbook for a computer science undergraduate course or a reference book for practitioners working on relevant problems in analyzing and managing text data.
