

## STATIC ELECTRICITY

### Electric Charge

Static electricity describes the situation when electric charges remain stationary. This occurs best with insulators. Electric charge can be either positive or negative.

### Production Electro-Static Electricity

When certain insulating materials are rubbed against each other they become electrically charged. Electrons are transferred from one material into the other.

- The material that gains electrons become negatively charged.
- The material that loses electrons is left with an equal positive charge.

**NB:** Only electrons move.

**Polythene and ebonite** gain extra electrons when they are rubbed and become negatively charged. **Cellulose acetate, perspex and glass** have electrons removed when they are rubbed and become positively charged.

The symbol for charge is **Q**. Charge is measured in **coulomb (C)**

### Attraction and repulsion force

Two bodies that carry different types of charge attract.

Two bodies that carry the same type of charge repel.

### THE LAW OF CHARGES:

**LIKE CHARGES REPEL, UNLIKE CHARGES ATTRACT.**

### Examples of Electro-Static Electricity

When a charged object is brought close to an uncharged one the two objects attract each other

The charged comb attracts the column of water

Charged balloon attracted to a wall

This boy's hair has all the same type of charge!

### TESTING FOR A CHARGE

Repulsion between two objects is a reliable test that they are both charged. The electroscope uses repulsion to indicate that material is charged.

When a charged object is brought close to the metal cap,

- Electrons are either repelled from the metal cap to the gold leaf and metal stem or
- Electrons are attracted to the metal cap from the metal stem and gold leaf.

Charged rod brought near metal plate of electroscope

- When the metal plate and the gold leaf have similar charges, they will repel each other. When the object is removed, the leaf falls fully.
- If the deflection reduces or leaf collapses, the charge will be unlike that of the electroscope

When the leaf is raised and the metal cap touched with a finger or earthed, the electrons will either move from metal

[A Student's Guide Through the Great Physics Texts](#) Kerry Kuehn, 2015-12-14 This book provides a chronological introduction to the electromagnetic theory of light using selected extracts from classic texts such as Gilbert's De Magnete, Franklin's Experiments and Observations on Electricity and Huygens' Treatise on Light. Particular attention is given to the works of Faraday, Maxwell and Heaviside, scientists who unified the formerly separate disciplines of electricity, magnetism and light. Their electromagnetic theory developed during the 19th century would lead to the invention of modern radar, electrical power grids and telecommunication networks. Each chapter of this book begins with a short introduction followed by a reading selection. Carefully crafted study questions draw out key points in the text and focus the reader's attention on the author's methods, analysis and conclusions. Numerical and laboratory exercises at the end of each chapter test the reader's ability to understand and apply key concepts from the text. Electricity, Magnetism and Light is the third of four volumes in A Student's Guide through the Great Physics Texts. This book grew out of a four semester undergraduate physics curriculum designed to encourage a critical and circumspect approach to natural science while at the same time preparing students for advanced coursework in physics. This book is particularly suitable as a college level textbook for students of the natural sciences, history or philosophy. It can also serve as a textbook for advanced high school or home schooled students or as a thematically organized source book for scholars and motivated lay readers. In studying the classic scientific texts included herein, the reader will be drawn toward a lifetime of contemplation.
