Three Views Of The Same Object:

Supplementary Notes for Mechanical Drawing Frank E. Mathewson, 1910 **Object Recognition in Man, Monkey, and Machine** Michael J. Tarr, Heinrich H. Bulthoff, 1999-03-15 The contributors bring a wide range of methodologies to bear on the common problem of image based object recognition. These interconnected essays on three dimensional visual object recognition present cutting edge research by some of the most creative neuroscientific cognitive and computational scientists in the field. Cassandra Moore and Patrick Cavanagh take a classic demonstration the perception of two tone images and turn it into a method for understanding the nature of object representations in terms of surfaces and the interaction between bottom up and top down processes. Michael J. Tarr and Isabel Gauthier use computer graphics to study whether viewpoint dependent recognition mechanisms can generalize between exemplars of perceptually defined classes. Melvyn A. Goodale and G. Keith Humphrey use innovative psychophysical techniques to investigate dissociable aspects of visual and spatial processing in brain injured subjects. D. I. Perrett, M. W. Oram, and E. Ashbridge combine neurophysiological single cell data from monkeys with computational analyses for a new way of thinking about the mechanisms that mediate viewpoint dependent object recognition and mental rotation. Shimon Ullman also addresses possible mechanisms to account for viewpoint dependent behavior but from the perspective of machine vision. Finally Philippe G. Schyns synthesizes work from many areas to provide a coherent account of how stimulus class and recognition task interact. The contributors bring a wide range of methodologies to bear on the common problem of image based object recognition. *Invariant Recognition of Visual Objects* Evgeniy Bart, Jay Hegdé, This Research Topic will focus on how the visual system recognizes objects regardless of variations in the viewpoint, illumination, retinal size, background, etc. Contributors are encouraged to submit articles describing novel results, models, viewpoints, perspectives, and/or methodological innovations relevant to this topic. The issues we wish to cover include but are not limited to perceptual invariance under one or more of the following types of image variation: Object shape, Task, Viewpoint, from the translation and rotation of the object relative to the viewer, Illumination, shading and shadows, Degree of occlusion, Retinal size, Color, Surface texture, Visual context including background clutter and crowding, Object motion including biological motion. Examples of questions that are particularly interesting in this context include but are not limited to: Empirical characterizations of properties of invariance does invariance always exist? How wide is its range and how strong is the tolerance to viewing conditions within this range? Invariance in naïve vs. experienced subjects? Is invariance built in or learned? How can it be learned under which conditions and how effectively? Is it learned incidentally or are specific task and reward structures necessary for learning? How is generalizability and transfer of learning related to the generalizability of invariance of perception? Invariance during inference? Are there conditions e.g. fast presentation time or otherwise resource constrained recognition when invariance breaks? What are some plausible computational or neural mechanisms by which invariance could be achieved? Integrating Computational and Neural Findings in Visual Object Perception Judith C.

Peters,Hans P. Op de Beeck,Rainer Goebel,2016-06-29 The articles in this Research Topic provide a state of the art overview of the current progress in integrating computational and empirical research on visual object recognition Developments in this exciting multidisciplinary field have recently gained momentum High performance computing enabled breakthroughs in computer vision and computational neuroscience In parallel innovative machine learning applications have recently become available for datamining the large scale high resolution brain data acquired with ultra high field fMRI and dense multi unit recordings Finally new techniques to integrate such rich simulated and empirical datasets for direct model testing could aid the development of a comprehensive brain model We hope that this Research Topic contributes to these encouraging advances and inspires future research avenues in computational and empirical neuroscience

How to Read a Drawing

Vincent C. Getty,1912 *Visual Object Processing* Glyn W. Humphreys,M. Jane Riddoch,2017-03-27 Originally published in 1987 this book attempted to bring together work by researchers concerned with the functional and neurological mechanisms underlying visual object processing and the ways in which such mechanisms can be neurologically impaired The editors termed it a Cognitive Neuropsychological approach because they believed it tried to relate evidence from neurological impairments of visual object processing to models of normal performance in a new and important way Two broad aims are apparent One is to test models of normal performance by evaluating how well the models account for the patterns of impairment and preservation of abilities that can occur following brain damage The other is to use models of normal performance to further their understanding of acquired disorders of visual object processing These aims distinguish the approach from neuropsychological work whose primary aim is to relate acquired deficits to the sites of damage and from work in the field of cognitive psychology which attempts only to develop models of normal performance
