1.1 INTRODUCTION

Since our childhood we have been using four fundamental operations of addition, subtraction, multiplication, and division. We have applied these operations on natural numbers, integers, rational and irrational numbers. In this chapter, we will begin with a brief recall of divisibility in integers and discuss some important properties of integers, namely, Bézout's Identity, Euclid's Division Lemma, and the Fundamental Theorem of Arithmetic. We will learn more about integers and real numbers.

of integers. It is quite easy to state and can be divided by any other positive integer that is smaller than it. This is nothing but the division lemma procedure on a sequence of integers. This division procedure is used for finding the HCF of positive integers.

about expressing positive integers as product of prime integers. This theorem has lots of other fields. We have learnt how to prove using the Fundamental Theorem of Arithmetic. We will apply this theorem to prove the LCM etc. We know that the decimal fraction is a non-terminating non-recurring decimal of a rational number representation. In fact, by looking at the tail numbers one can easily tell about its non-terminating repeating. We will also determine the nature of the decimal

1.2 DIVISIBILITY

We have been studying division of fractions for the last many years. Let us recall the same in a formal manner.

DEFINITION. A non-zero integer N is said to divide an integer M if there exists an integer q such that $M = Nq$.
