User demands on the systems have risen continuously in recent years In addition more and more software products
especially the operating systems Windows themselves no longer calculate the graphic representation on the CPU Central
Processing Unit Instead they calculate it on the GPU Graphics Processing Unit optimized for this purpose If no GPU is
available the calculation continues to be performed on the CPU Especially when using virtual desktops i e desktops that are
provided in the data center the lack of GPU is often a clear disadvantage compared to classic PCs In addition the load on the
corresponding servers is getting significantly higher and the number of users per physical server decreases The costs per
user increase The industry recognized this disadvantage several years ago and introduced the GPU Pass through technology
A physical graphics card is assigned to a virtual machine This can then use the full power of the graphics card but each
virtual machine requires its own graphics card The costs per user increase To resolve this issue NVIDIA has released GRID
technology This makes it possible for several virtual machines to share a graphics card but still maintain full performance
similar to what already happens in all virtual environments with the CPU You will learn what to consider when planning a v
