

Reaction Rates and Equilibrium Study Guide

ANSWER KEY

- Describe how each of the following factors would affect the rate of a chemical reaction in terms of "particle collisions" in your response.
 - Temperature decreases** *If temperature decreases, the particles move slower and there will be less reactant particle collisions AND a smaller percentage of particles have enough energy to produce a reaction. The reaction rate will therefore decrease.*
 - Addition of iodide ions, I^- , as a catalyst** *The presence of the catalyst speeds up the reaction taking place. This means that a larger percentage of particles have enough energy to produce a reaction. The reaction rate will therefore increase.*
 - Increased reactant concentration** *With more reactant particles in the same volume, there are more collisions between those particles. This means the reaction rate will increase.*
 - Crushing a solid into a powder (with larger surface area)** *As a powder, there is more surface area for collisions to take place. This means there will be more collisions and therefore a faster reaction rate.*
- The reaction progress diagram shows the energy changes that take place when nitrogen dioxide gas reacts with carbon monoxide gas to form carbon dioxide gas and nitrogen gas.

Chemistry 3rd Edition is not merely a compilation of principles but rather it is a disciplined method of thought and analysis. Success in organic chemistry requires mastery in two core aspects: fundamental concepts and the skills needed to apply those concepts and solve problems. Readers must learn to become proficient at approaching new situations methodically based on a repertoire of skills. These skills are vital for successful problem solving in organic chemistry. Existing textbooks provide extensive coverage of the principles but there is far less emphasis on the skills needed to actually solve problems.
