Using Additional Information in Streaming

Algorithms Raffael Buff,2016-12 Streaming problems are algorithmic problems that are mainly characterized by their massive input streams Because of these data streams the algorithms for these problems are forced to be space efficient as the input stream length generally exceeds the available storage The goal of this study is to analyze the impact of additional information more specifically a hypothesis of the solution on the algorithmic space complexities of several streaming problems To this end different streaming problems are analyzed and compared The two problems most frequent item and number of distinct items with many configurations of different result accuracies and probabilities are deeply studied Both lower and upper bounds for the space and time complexity for deterministic and probabilistic environments are analyzed with respect to possible improvements due to additional information The general solution search problem is compared to the decision problem where a solution hypothesis has to be satisfied
