The Zen of Exotic Computing Peter M. Kogge, 2022-12-07 The Turing von Neumann model of computing is dominant today but is by no means the only one This textbook explores an important subset of alternatives including those such as quantum and neuromorphic which receive daily news attention The models are organized into distinct groups After a review of the Turing von Neumann model to set

the stage the author discusses those that have their roots in the Turing von Neumann model but perform potentially large numbers of computations in parallel models that do away with the preplanned nature of the classical model and compute from just a statement of the problem others that are simply mathematically different such as probabilistic and reversible computation models based on physical phenomena such as neurons and finally those that leverage unique physical phenomena directly such as quantum optical and DNA based computing Suggested readings provide a jumping off point for deeper learning A supplemental website contains chapters that did not make it into the book as well as exercises projects and additional resources that will be useful for more in depth investigations The Zen of Exotic Computing is intended for computer science students interested in understanding alternative models of computing It will also be of interest to researchers and practitioners interested in emerging technology such as quantum computing machine learning and AI
