

# BOOK REVIEWS: How to write a book review

There are two approaches to book reviewing:

**Descriptive reviews:** give the essential information about a book. This is done with description and exposition, by stating the perceived aims and purposes of the author, and by quoting striking passages from the text.

**Critical reviews:** describe and evaluate the book, in terms of accepted literary and historical standards, and supports this evaluation with evidence from the text. The following pointers are meant to be suggestions for writing a critical review.

## Basic requirements

To write a critical review, the reviewer must know two things:

**Knowing the work under review:** This demands not only attempting to understand the author's purpose and how the component parts of the work contribute to that purpose, but also knowledge of the author: his/her nationality, time period, other works etc.

**Requirements of the genre:** This means understanding the art form and how it functions. Without such context, the reviewer has no historical or literary standard upon which to base an evaluation.

## Reviewing essentials

**Description of the book:** Sufficient description should be given so that the reader will have some understanding of the author's thoughts. This account is not a summary. It can be woven into the critical remarks.

**Discuss the author:** Biographical information should be relevant to the subject of the review and enhance the reader's understanding of the work under discussion.

**Appraise the book:** A review must be a considered judgment that includes:

- a statement of the reviewer's understanding of the author's purpose
- how well the reviewer feels the author's purpose has been achieved
- evidence to support the reviewer's judgement of the author's achievement.

## While you read:

- Read the book with care.
- Highlight quotable passages.
- Note your impressions as you read.
- Allow time to assimilate what you read so that the book can be seen in perspective.
- Keep in mind the need for a single impression which must be clear to the reader.

**American Monthly Review of Reviews** Albert Shaw,1928 *Sequencing and Phylogenetic Analysis as a Tool in Molecular Epidemiology of Veterinary Infectious Diseases, volume II* Iryna Goraichuk,Amro Hashish ,Mohamed H. Maarouf,2025-12-03 The development of sequencing technologies dramatically changed the course of epidemiological studies of infectious diseases Virus genomics have already been used to investigate infectious disease outbreaks for several decades

Since the introduction of Next generation Sequencing NGS the viral or bacterial whole genomes can be sequenced in a matter of days. Now thanks to advances in high throughput sequencing and decreasing costs most virus genomics studies utilize data sets containing tens to thousands of complete genomes. While well established sequencing platforms still provide robust insights, the real time sequencing approaches and analysis opens up entirely new applications in the field of molecular epidemiology. The advances in genome sequence technologies have improved the ability to track and understand the bacterial and viral transmission of animal diseases. Phylogenetic analysis of these genomes can be used to clarify the key questions in infectious disease epidemiology from the initial detection and characterization of outbreak viruses to transmission chain tracking and outbreak mapping which can now be much more accurately addressed using recent advances in virus sequencing and phylogenetics. The threat of emerging and re-emerging infectious diseases continues to be a challenge to public and global health security as well as animal health and highlights that sequencing is not just a critical tool in bio surveillance, it can also play a major role in pandemic or outbreak response. The scope of the Research Topic is to explore the current status and future perspectives of sequencing technologies in the control and prevention of infectious diseases including the elucidation of diagnosis, molecular evolution, distribution and transmission of important veterinary infectious diseases. The collection welcomes but is not limited to Original Research, Methods and Reviews in the following areas:

Molecular surveillance of specific infections at the local, national and international levels. Rapid detection and characterization of emerging pathogens. Whole and partial genome sequencing of viral and bacterial isolates. Short and long read sequencing approaches for infectious diseases control and prevention. Development of new bioinformatic tools for NGS data analysis.

*Tractor and Gas Engine Review*, 1913      **New Avenues for the Development of Advanced Immunotherapies: Capitalizing on Studies of the B and T Cell Receptor Repertoire** Massimiliano Mazza, Fabio Nicolini, Maria Del Mar Naranjo Gomez, Mireia Pelegrin, 2025-11-20

Immunotherapy has emerged as a transformative domain within oncology and a variety of other medical fields, demonstrating its potential through the use of immune checkpoint inhibitors, adoptive cell therapies, and monoclonal antibodies. These strategies have significantly improved cancer treatment outcomes and broadened therapeutic horizons. Nonetheless, the clinical application of numerous therapeutic and diagnostic targets remains limited, reducing the translational impact of molecular biology advances. NGS-based technologies focusing on B and T cell receptor repertoires have enabled the development of next-generation immunotherapies such as CAR therapies, engineered antibodies, and bispecific antibodies, enhancing treatment options across infectious diseases, autoimmune disorders, and cancers. This Research Topic aims to provide a comprehensive summary of current methodologies used in the creation and development of pertinent immunotherapies. It seeks to present an up-to-date exploration of the rapidly evolving fields of antibody development and immune receptor repertoire analysis, emphasizing their clinical relevance across various

disease states including autoimmune and infectious diseases and particularly cancer To expand the boundaries of molecular immunology and immunotherapy development this Research Topic encourages contributions that explore diverse aspects including but not limited to o Novel techniques for discovering and crafting antibodies and receptor specific molecules ScFv VHH o Innovative methods for identifying antigens associated with antibodies and TCRs o Creation of databases cataloging T and B cell receptor repertoires from individuals and patients exposed to specific conditions o Preclinical studies validating the efficacy of targeted immunotherapies and diagnostics such as CAR therapies ADCs BiTEs and companion diagnostics With the adoption of advanced tools like NGS in receptor complexity analysis and screening the future of immunotherapy looks promising potentially ushering in a new era of enhanced specificity and efficacy in treatment across multiple diseases Contributions ranging from original research articles to comprehensive reviews are welcomed to deepen understanding and push the boundaries of this exciting field Manuscripts consisting solely of bioinformatics or computational analysis of public genomic or transcriptomic databases which are not accompanied by robust and relevant validation clinical cohort or biological validation in vitro or in vivo are out of scope for this topic
