Vector Optimization Theory Applications And Extensions:

Vector Optimization Johannes Jahn, 2013-06-05 In vector optimization one investigates optimal elements such as minimal strongly minimal properly minimal or weakly minimal elements of a nonempty subset of a partially ordered linear space. The problem of determining at least one of these optimal elements if they exist at all is also called a vector optimization problem. Problems of this type can be found not only in mathematics but also in engineering and economics. Vector optimization problems arise for example in functional analysis, the Hahn-Banach theorem, the lemma of Bishop-Phelps, Ekeland's variational principle, multiobjective programming, multi-criteria decision making, statistics, Bayes solutions, theory of tests, minimal covariance matrices, approximation theory, location theory, simultaneous approximation, solution of boundary value problems and cooperative game theory, cooperative n -player differential games and as a special case optimal control problems. In the last decade vector optimization has been extended to problems with set-valued maps. This new field of research called set optimization seems to have important applications to variational inequalities and optimization problems with multivalued data. The roots of vector optimization go back to F.Y. Edgeworth (1881) and V. Pareto (1896) who has already given the definition of the standard optimality concept in multiobjective optimization. But in mathematics this branch of optimization has started with the legendary paper of H.W. Kuhn and A.W. Tucker (1951). Since about the end of the 60's research is intensively made in vector optimization.

Vector Optimization Johannes Jahn, 2011-03-30 **Basic Mathematical Programming Theory** Giorgio Giorgi, Bienvenido Jiménez, Vicente Novo, 2023-07-18 The subject of static optimization, also called mathematical programming, is one of the most important and widespread branches of modern mathematics, serving as a cornerstone of such scientific subjects as economic analysis, operations research, management sciences, engineering, chemistry, physics, statistics, computer science, biology, and social sciences. This book presents a unified, progressive treatment of the basic mathematical tools of mathematical programming theory. The authors expose said tools along with results concerning the most common mathematical programming problems formulated in a finite dimensional setting, forming the basis for further study of the basic questions on the various algorithmic methods and the most important particular applications of mathematical programming problems. This book assumes no previous experience in optimization theory, and the treatment of the various topics is largely self-contained. Prerequisites are the basic tools of differential calculus for functions of several variables, the basic notions of topology and of linear algebra, and the basic mathematical notions and theoretical background used in analyzing optimization problems. The book is aimed at both undergraduate and postgraduate students interested in mathematical programming problems, but also those professionals who use optimization methods and wish to learn the more theoretical aspects of these questions. *Pareto Optimality, Game Theory and Equilibria* Panos M.
