**Systems Engineering Models** Jens Frieben, 2017 Designing and scaling complex networked automation systems is a challenging task Developers must consider different kinds of influence factors that impact the system performance already in the early stages of the development If performance bottlenecks are detected too late costly corrections may follow and the commissioning can be significantly delayed There already exist several approaches to predict the performance of a system under development However developers must identify and decide themselves which factors must be regarded for a performance analysis and to what detail Therefore developers usually require in depth knowledge of the system which is at least to this level of detail not available until the discipline specific development starts In particular it is not clear which factors influence the performance of a PLC and how these can be used for an early validation of a system model The first contribution of this thesis is the identification and creation of a list of influence factors that impact one or more quality of service attributes of an automation system For each factor a decision is made whether it is available in the early development stages what assumptions must be made by the developer and what impact it has on the overall system performance The second contribution is a method that enables developers of automated systems to define the identified influence factors in systems engineering models and to carry out a subsequent automatic performance analysis The method includes a model for the specification of influence factors within an existing Systems Engineering model as well as an accompanying process Based on these models an analysis can be performed to predict the utilization of a selected PLC The results can be used to evaluate the design of the automation in the early phases and therefore avoid costly and eng **AutomationML** Rainer Drath, 2021-07-19 This book provides a comprehensive in depth look into the practical application of AutomationML Edition 2 from an industrial perspective It is a cookbook for advanced users and describes re usable pattern solutions for a variety of industrial applications and how to implement it in software Just to name some AutomationML modelling of AAS MTP SCD OPC UA Automation Components Automation Projects drive configurations requirement models communication systems electrical interfaces and cables or semantic integration aspects as eClass integration or handling of semantic heterogeneity This book guides through the universe of AutomationML from industrial perspective It is written by AutomationML experts that have industrially implemented AutomationML in pattern solutions for a large variety of applications This book is structured into three major parts Part I software implementation for developers Part II re usable industrial pattern solutions and domain models Part III outlook into future AutomationML applications Additional material to the book and more information about AutomationML on the website <https://www.automationml.org> about automationml publications amlbook
