Finite Element Bibliography Gerard De Vries, 1976-12. This bibliography had its inception in 1967 when the compilers first attempted a comprehensive coverage of the finite element literature using both manual and computer-based retrieval. Initially the data base was stored on a card index but this was subsequently transferred to punched cards and magnetic tape. Computer processing was adopted at an early stage to derive the three index formats from the data base. Over the subsequent years

several versions of the bibliography were produced with two of these being made available in a report form to other researchers. From the widespread interest in these documents it became evident that there was a need for a commercially available comprehensive bibliography in this area. A major effort was undertaken to revise, update and extend the data base resulting in this present volume. The bibliography covers the period 1956-1975 primarily, although some earlier publications of historical interest are included. The citations are not restricted to the English language and documents are listed in many languages and from diverse places of origin. All publication formats were accepted so that references will be found to books, monographs, journal papers and articles, theses, dissertations, reports, surveys and the like.

Experimental Characterization of the Pullout and Gap Opening Behavior of Misaligned Dowel Bars Under Thermal Expansion Deepa Thandaveswara, 2005 **A Surface Performance-graded (SPG) Specification for Surface Treatment Binders** Lubinda F. Walubita, 2005. Presently, surface treatment design and material selection is based on traditional specifications and experience which are not performance based and sometimes result in inadequate performance of the surface treatment. In 2000, the first phase of a Texas Department of Transportation (TxDOT) research project developed a surface performance graded (SPG) specification for the selection of surface treatment binders. Research Report 1710-1. The SPG specification is performance based and utilizes binder properties directly related to surface treatment performance and associated distress. The specification takes into account environmental conditions, aging effects of the binder, visco-elastic behavior and reliability. The objective of this second phase of the project was to investigate and establish the validity and applicability of the proposed SPG specification, make modifications where necessary and finally recommend the SPG specification for practical implementation. The research methodology involved highway section identification, laboratory

testing including SPG grading performance monitoring and comparison of the SPG binder grades to actual field performance. Factors included in the experimental design were binder type and suppliers environment aggregates and traffic. Analyses of the results showed that there is generally a good correlation between the proposed SPG specification and actual field performance. Overall the results are indicative that the SPG specification is functional and if properly applied the specification promises to be a relatively cost effective method for selecting binders to ensure adequate surface treatment performance. However further validation is recommended possibly with controlled test sections to fully investigate the effects of design construction and quality control processes and address some of the deficiencies of the specification.
