

## ELECTRICITY AND MAGNETISM

### SAMPLE PROBLEMS

1. How many coulombs do  $150.4 \times 10^{16}$  electrons represent?

Solution:

$$Q = \frac{\text{number of electrons}}{6.25 \times 10^{18} \text{ electrons/C}} = \frac{150.4 \times 10^{16} \text{ electrons}}{6.25 \times 10^{18} \text{ electrons/C}} = 0.24 \text{ C}$$

2. If 100 J of energy are available for every 15 C of charge, what is the voltage?

Solution:

$$V = \frac{W}{Q} = \frac{100 \text{ J}}{15 \text{ C}} = 20 \text{ V}$$

3. Fifteen coulombs of charge flow past a given point in a wire in 3 s. What is the current in amperes?

Solution:

$$I = \frac{Q}{t} = \frac{15 \text{ C}}{3 \text{ s}} = 5 \text{ A}$$

4. If the flux density in a certain magnetic material is 0.25 T and the area of the material is 0.35  $\text{m}^2$ , what is the flux through the material?

Solution:

$$A = 0.35 \text{ m}^2 \times \frac{1 \text{ m}^2}{(39.37 \text{ in})^2} = 225.81 \times 10^{-6} \text{ m}^2$$

$$\Phi = \beta A = (0.25 \text{ T})(225.81 \times 10^{-6} \text{ m}^2) = 56.45 \mu \text{Wb}$$

## **Solution Of Problems From Jacksons Electricity Magnetism:**

*Analysis and Computation of Electric and Magnetic Field Problems* K. J. Binns, P. J. Lawrenson, 2013-10-22 Analysis and Computation of Electric and Magnetic Field Problems Second Edition is a comprehensive treatment of both analytical and numerical methods for the derivation of two dimensional static and quasi static electric and magnetic fields. The essence of each method of solution is emphasized and the scopes of the different methods are described with particular regard to the influence of digital computers. This book is comprised of 12 chapters and begins with an introduction to the fundamental theory of electric and magnetic fields. The derivation of quantities of physical interest such as force, inductance and capacitance from the field solution is explained. The next section deals with the methods of images and separation of variables and presents direct solutions of Laplace's equation and of Poisson's equation. The basic solutions are developed rigorously from considerations of surface charges and are expressed in complex variable form. Subsequent chapters discuss transformation methods as well as line and doublet sources, the transformation of regions exterior to finite boundaries and the powerful numerical methods used to enlarge the scope of conformal transformation. The last section is devoted to finite difference methods and the Monte Carlo method along with all classes of boundary shape and condition. This monograph is intended primarily for engineers, physicists and mathematicians as well as degree students towards the end of their courses.

**Electromagnetic Theory** Jack Vanderlinde, 2006-01-17 In questions of science the authority of a thousand is not worth the humble reasoning of a single individual. Galileo Galilei physicist and astronomer 1564-1642 This book is a second edition of Classical Electromagnetic Theory which derived from a set of lecture notes compiled over a number of years of teaching electromagnetic theory to fourth year physics and electrical engineering students. These students had a previous exposure to electricity and magnetism and the material from the first four and a half chapters was presented as a review. I believe that the book makes a reasonable transition between the many excellent elementary books such as Griffith's Introduction to Electrodynamics and the obviously graduate level books such as Jackson's Classical Electrodynamics or Landau and Lifshitz Electrodynamics of Continuous Media. If the students have had a previous exposure to Electromagnetic theory, all the material can be reasonably covered in two semesters. Neophytes should probably spend a semester on the first four or five chapters as well as depending on their mathematical background the Appendices B to F. For a shorter or more elementary course the material on spherical waves, waveguides and waves in anisotropic media may be omitted without loss of continuity.
