The authors also highlight applications of mmW antennas in 5G wireless communication and next generation radar systems. Readers are prepared to put techniques into practice through practical discussions of how to set up testing for impedance matching radiation patterns gain from 24GHz up to 325 GHz and more. This book will bring readers state of the art designs and recent progress in substrate integrated mmW antennas for emerging wireless applications. Substrate Integrated Millimeter Wave Antennas for Next Generation Communication and Radar Systems is the first comprehensive text on the topic allowing readers to quickly master mmW technology. This book introduces basic concepts such as metamaterials, Huygens' surface zero index structures and pattern synthesis. Describes prototyping in the form of fabrication based on printed circuit board, low temperature co fired ceramic and micromachining. Explores applications for next generation radar and imaging systems such as 24 GHz and 77 GHz vehicular radar systems. Elaborates design methods including waveguide based feeding network, three dimensional feeding structure, dielectric loaded aperture antenna element and low sidelobe synthesis. The mmW is one of today's most important emerging technologies. This book provides graduate students, researchers and engineers with the knowledge they need to deploy mmW systems and develop new antenna designs with low cost, low loss and low complexity.

Mohamed Hamed Awida Hassan, 2011. Mobile communication has become an essential part of our daily life. We love the flexibility of wireless cell phones and even accept their lower quality of service when compared to wired links. Similarly we are looking forward to the day that we can continue watching our favorite TV programs while travelling anywhere and everywhere including satellite channels and the wish list goes on. Mobility, flexibility and portability are the themes of the next generation communication. Motivated and fascinated by such technology breakthroughs this effort is geared towards enhancing the quality of wireless services and bringing mobile satellite reception one step closer to the market. On the other hand phased array antennas are vital components for RADAR applications where the antenna is required to have certain scan capabilities. One of the main concerns in that perspective is how to avoid the potential of scan blindness in the required scan range. Targeting to achieve wideband wide scan angle phased arrays free from any scan blindness our efforts is also geared. Conventionally the key to lower the profile of the antenna is to use planar structures. In that perspective microstrip patch antennas have drawn the attention of antenna engineers since the 1970s due to their attractive features of being low profile, compact size, light weight and amenable to low cost PCB fabrication processes. However patch elements are basically resonating at a single frequency.
