Over recent years industries have faced the problem of how to connect devices to speak to each other with minimum wiring Philips Semiconductors faced this problem when they needed to connect many ICs together The Automotive Industry faced the same problem when it needed to connect tens of microcontrollers in each car Recently with smart homes the problem has started to be part of each home For instance you may want to build your smart home with accessories from different manufacturers and you want the devices to speak to each other Added to that you may want to control them from a central App or voice assist Solutions for this problem started with the introduction of Inter Integrated Circuits IIC and Controller Area Networks CAN Both solutions are wired networks that allow ICs and microcontrollers to be connected in a network to communicate together In smart home automation a number of common smart home automation protocols that allow different devices to speak and communicate together have appeared during the last few decades Some of the smart home protocols come under the umbrella of what is called the Internet of Things IoT The proposed protocols can be grouped into wired networks e g X10 UPB wireless or radio networks as ZigBee Z Wave Bluetooth or dual wired and radio such as Insteon This book introduces to the reader some of the most popular Microcontroller and Smart home networks The book covers in detail the following protocols I2C I3C CAN ZigBee ZigBee Pro Z Wave Bluetooth Wi Fi WiMax and Insteon are part of our companion book Serial Communication Protocols and Standards This book gives detailed comparisons between the various protocols To complete the knowledge of the reader the book gives in the last chapter a short summary on the protocols that we did not fully cover in this volume Ethernet Thread Insteon X10 and UPB *Materials, Mechatronics and Automation II*

**of Cooperating Objects** Pedro José Marron,Stamatis Karnouskos,Daniel Minder,Aníbal Ollero,2011-01-19 There are a number of different system concepts that have gained much relevance in the area of embedded systems over the past couple of years First there is the classic concept of embedded systems where the focus is on control systems for physical processes Secondly the notion of pervasive computing has evolved where the vision foresees everyday objects having some form of computation capacity and in most cases sensing and communication facilities Thirdly the notion of wireless sensor networks has arisen where small computing devices are able to sense their environment and cooperate in order to achieve a well defined goal These three types of quite diverse systems share a lot of commonalities on the one hand and on the other hand have some complementary aspects in common that make a combination of these systems into a coherent system vision promising In particular the important notions of control heterogeneity wireless communication dynamic and ad hoc nature and cost are prevalent to various degrees in each of these systems A future system concept needs to combine the strong points of all three system concepts in at least these functional aspects It has to provide support for the control of physical processes like today s embedded systems do have as good support for device heterogeneity and spontaneity of usage as required by pervasive and ubiquitous computing approaches and has to be as cost efficient and wirelessly agile as wireless sensor networks are These new systems consist therefore of individual entities or objects that jointly strive to reach a common goal which will typically be a goal in sensing or control and are dynamically and loosely federating themselves for cooperation taking care not to overtax their available resources This book presents a roadmap to these concepts which are summarized as cooperating objects
