

three laws of motion and his law of gravity, which accounted for the orbits of the earth, moon, and planets, and explained phenomena such as the tides. The handful of equations he created, and the elaborate mathematical framework we have since derived from them, are still taught today, and employed whenever an architect designs a building, an engineer designs a car, or a physicist calculates how to aim a rocket meant to land on Mars. As the poet Alexander Pope said:

—Nature and Nature's laws lay hid in night—

—God said: Let Newton be! and all was light.—

Your comment

Today most scientists would say a law of nature is a rule that is based upon an observed regularity and provides predictions **that go beyond the immediate** situations upon which it is based. For example, we might notice that the sun has risen in the east every morning of our lives, and postulate the law "The sun always rises in the east." This is a generalization that goes beyond our limited observations of the rising sun and makes testable predictions about the future. On the other hand, a statement such as "The computers in this office are black" is not a law of nature because it relates only to the computers within the office and makes no predictions such as "If my office purchases a new computer, it will be black."
