Symbolic Computation For Statistical Inference Oxford Statistical Science Series:

Symbolic Computation for Statistical Inference David F. Andrews, James E. H. Stafford, 2000 Over recent years developments in statistical computing have freed statisticians from the burden of calculation and have made possible new methods of analysis that previously would have been too difficult or time consuming Up till now these developments have been primarily in numerical computation and graphical display but equal steps forward are now being made in the area of symbolic computing or in other words the use of computer languages and procedures to manipulate expressions This allows researchers to compute an algebraic expression rather than evaluate the expression numerically over a given range This book summarizes a decade of research into the use of symbolic computation applied to statistical inference problems It shows the considerable potential of the subject to automate statistical calculation leaving researchers free to concentrate on new concepts Starting with the development of algorithms applied to standard undergraduate problems the book then goes on to develop increasingly more powerful tools Later chapters then discuss the application of these algorithms to different areas of statistical methodology *Tensor Methods in Statistics* Peter McCullagh, 2018-07-18 A pioneering monograph on tensor methods applied to distributional problems arising in statistics this work begins with the study of multivariate moments and cumulants An invaluable reference for graduate students and professional statisticians 1987 edition

Principles of Multivariate Analysis Wojtek Krzanowski, 2000-09-28 This book is an introduction to the principles and methodology of modern multivariate statistical analysis It is written for the user and potential user of multivariate techniques as well as for students coming to the subject for the first time The author's emphasis is problem orientated and he is at pains to stress geometrical intuition in preference to algebraic manipulation Mathematical sections that are not essential for a practical understanding of the techniques are clearly indicated so that they may be skipped by the non specialist Discrete and mixed variable techniques are presented as well as continuous variable techniques to give a comprehensive coverage of the subject This updated edition includes a new appendix which traces developments that have taken place in the years since the publication of the first edition and which clarifies some issues raised by readers of the original text References to about 60 recent books and articles supplement the material in this appendix Overall this volume provides an up to date and readable practical account of the subject both for students of statistics and for research workers in subjects as diverse as anthropology education industry medicine and taxonomy The new edition includes a survey of the most recent developments in the subject *Analysis of Longitudinal Data* Peter Diggle, 2002-06-20 Analysis of longitudinal data involves aspects of both time series and multivariate analysis Modern computer packages make these calculations possible and have lead to refinement of the techniques

Highly Structured Stochastic Systems Peter J. Green, Nils Lid Hjort, Sylvia Richardson, 2003 Highly Structured Stochastic Systems HSSS is a modern strategy for building statistical models for challenging real world problems for computing with them and for interpreting the resulting inferences Complexity is handled

by working up from simple local assumptions in a coherent way and that is the key to modelling computation inference and interpretation the unifying framework is that of Bayesian hierarchical models The aim of this book is to make recent developments in HSSS accessible to a general statistical audience Graphical modelling and Markov chain Monte Carlo MCMC methodology are central to the field and in this text they are covered in depth The chapters on graphical modelling focus on causality and its interplay with time the role of latent variables and on some innovative applications Those on Monte Carlo algorithms include discussion of the impact of recent theoretical work on the evaluation of performance in MCMC extensions to variable dimension problems and methods for dynamic problems based on particle filters Coverage of these underlying methodologies is balanced by substantive areas of application in the areas of spatial statistics with epidemiological ecological and image analysis applications and biology including infectious diseases gene mapping and evolutionary genetics The book concludes with two topics model criticism and Bayesian nonparametrics that seek to challenge the parametric assumptions that otherwise underlie most HSSS models Altogether there are 15 topics in the book and for each there is a substantial article by a leading author in the field and two invited commentaries that complement extend or discuss the main article and should be read in parallel All authors are distinguished researchers in the field and were active participants in an international research programme on HSSS This is the 27th volume in the Oxford Statistical Science Series which includes texts and monographs covering many topics of current research interest in pure and applied statistics These texts focus on topics that have been at the forefront of research interest for several years Other books in the series include J Durbin and S J Koopman Time series analysis by State Space Models Peter J Diggle Patrick Heagerty Kung Yee Liang Scott L Zeger Analysis of Longitudinal Data 2 e J K Lindsey Nonlinear Models in Medical Statistics Peter J Green Nils L Hjort and Sylvia Richardson Highly Structured Stochastic Systems Margaret S Pepe Statistical Evaluation of Medical Tests

Numerical Methods for Nonlinear Estimating Equations Christopher G. Small, Jinfang Wang, 2003 Non linearity arises in statistical inference in various ways with varying degrees of severity as an obstacle to statistical analysis More entrenched forms of nonlinearity often require intensive numerical methods to construct estimators and the use of root search algorithms or one step estimators is a standard method of solution This book provides a comprehensive study of nonlinear estimating equations and artificial likelihood s for statistical inference It provides extensive coverage and comparison of hill climbing algorithms which when started at points of nonconcavity often have very poor convergence properties and for additional flexibility proposes a number of modification to the standard methods for solving these algorithms The book also extends beyond simple root search algorithms to include a discussion of the testing of roots for consistency and the modification of available estimating functions to provide greater stability in inference A variety of examples from practical applications are included to illustrate the problems and possibilities thus making this text ideal for the research statistician and graduate student

Nonlinear Models in Medical Statistics James K. Lindsey, 2001 This

text provides an introduction to the use of nonlinear models in medical statistics. It is a practical text rather than a theoretical one and assumes a basic knowledge in statistical modelling and of generalized linear models. The book first provides a general introduction to nonlinear models comparing them to generalized linear models. It describes data handling and formula definition and summarises the principal types of nonlinear regression formulae. There is an emphasis on techniques for non normal data. Following chapters provide detailed examples of applications in various areas of medicine: epidemiology, clinical trials, quality of life, pharmacokinetics, pharmacodynamics, assays and formulations, and molecular genetics. The book concludes with appendices describing data handling and model formulae in more detail and given ways of modelling dependencies in repeated measurements and data for the exercises.

Procrustes Problems John C Gower, Garnt B Dijkstra, 2004-01-22. Procrustean methods are used to transform one set of data to represent another set of data as closely as possible. The name derives from the Greek myth where Procrustes invited passers by in for a pleasant meal and a night's rest on a magical bed that would exactly fit any guest. He then either stretched the guest on the rack or cut off their legs to make them fit perfectly into the bed. Theseus turned the tables on Procrustes fatally adjusting him to fit his own bed. This text, the first monograph on Procrustes methods, unifies several strands in the literature and contains much new material. It focuses on matching two or more configurations by using orthogonal projection and oblique axes transformations. Group average summaries play an important part and links with other group average methods are discussed. This is the latest in the well established and authoritative Oxford Statistical Science Series which includes texts and monographs covering many topics of current research interest in pure and applied statistics. Each title has an original slant even if the material included is not specifically original. The authors are leading researchers and the topics covered will be of interest to all professional statisticians whether they be in industry, government department or research institute. Other books in the series include: 23 W J Krzanowski *Principles of multivariate analysis: a user's perspective* updated edition; 24 J Durbin and S J Koopman *Time series analysis by State Space Models*; 25 Peter J Diggle, Patrick Heagerty, Kung Yee Liang, Scott L Zeger *Analysis of Longitudinal Data* 2e; 26 J K Lindsey *Nonlinear Models in Medical Statistics*; 27 Peter J Green, Nils L Hjort, Sylvia Richardson *Highly Structured Stochastic Systems*; 28 Margaret S Pepe *The Statistical Evaluation of Medical Tests for Classification and Prediction*; 29 Christopher G Small and Jinfang Wang *Numerical Methods for Nonlinear Estimating Equations*.

Directional and Multivariate Statistics Somesh Kumar, Barry C. Arnold, Kunio Shimizu, Arnab Kumar Laha, 2025-05-05. This book contains select chapters on a range of topics in directional statistics, multivariate statistical inference, financial statistics, statistical machine learning, and reliability inference. At the 43rd Annual Convention of the Indian Society for Probability and Statistics (ISPS) held in Prayagraj (formerly Allahabad), Uttar Pradesh, India, from 6-8 February 2024, an attribute was paid to Prof. Ashis SenGupta on the occasion of his 70th birthday. He has pioneered research on directional statistics in the modern era in India and enhanced it worldwide and contributed significantly to the

 Theory of Arguments for Statistical Evidence Paul-Andre Monney,2003 The subject of this book is the reasoning under

 of generalized functional models for a discrete parameter is developed which leads to a general notion of weight of evidence
 The second part of the book is dedicated to the study of special linear functional models called Gaussian linear systems
 Finally it is shown that the celebrated Kalman filter can easily be derived by local propagation of Gaussian hints in a Markov
