Systems Design For Remote Healthcare:

Systems Design for Remote Healthcare Koushik Maharatna, Silvio Bonfiglio, 2013-11-13 This book provides a multidisciplinary overview of the design and implementation of systems for remote patient monitoring and healthcare. Readers are guided step by step through the components of such a system and shown how they could be integrated in a coherent framework for deployment in practice. The authors explain planning from subsystem design to complete integration and deployment given particular application constraints. Readers will benefit from descriptions of the clinical requirements underpinning the entire application scenario, physiological parameter sensing techniques, information processing approaches, and overall application dependent system integration. Each chapter ends with a discussion of practical design challenges and two case studies are included to provide practical examples and design methods for two remote healthcare systems with different needs.

Smart Remote Personal Health Monitoring System: Addressing Challenges of Missing and Conflicting Data Ye Zhu (Researcher in engineering system design and management), 2022 Clinical usage of Remote Patient Monitoring RPM systems has spurred during the past two years. Driven by an increase in demand during the COVID-19 pandemic, Internet of Medical Things (IoMT) systems are becoming much more diverse and prevalent. They are excellent candidates for monitoring patients' health status and disease state for predicting patients' response to treatment for alerting extraordinary acute or emergency events for analyzing and managing large datasets and for preventing disease progression and symptom manifestation. Although healthcare technology had improved over the years, two main challenges to enhance remote patient monitoring or improve professional telehealth programs continue to be interoperability and data handling. Many new solutions have been under investigation as the pandemic shifts the world's perspective on how healthcare should be performed to treat acute, chronic, psychological, and infectious diseases. This thesis first focuses on using a system thinking approach to design and architect a low cost and scalable RPM system for general applications. The key challenges and potential solutions are discussed from the system design and architecture points of view. To deep dive into particular data challenges faced by researchers implementing big data analytics for remote monitoring, the second part of this thesis selects the remote smart cardiac health monitoring system as the example system for detailed technical aspect analysis. Several deep learning methods including RNN, BRITS, GAN, DeepAR based methods are applied to address the missing data issues during remote monitoring. The methods

are tested and compared to each other A federated learning approach is also explored and proposed to be implemented in distributed remote patient monitoring systems for improving privacy and security Health Care Systems Eugene B.
