Secure Smart Embedded Devices, Platforms and Applications Konstantinos Markantonakis, Keith Mayes, 2013-09-14 New generations of IT users are increasingly abstracted from the underlying devices and platforms that provide and safeguard their services. As a result they may have little awareness that they are critically dependent on the embedded security devices that are becoming pervasive in daily modern life. Secure Smart Embedded Devices Platforms and Applications provides a broad overview of the many security and practical issues of embedded devices tokens and their operation systems platforms and main applications. It also addresses a diverse range of industry government initiatives and considerations while focusing strongly on technical and practical security issues. The benefits and pitfalls of developing and deploying applications that rely on embedded systems and their security functionality are presented. A sufficient level of technical detail to support embedded systems is provided throughout the text although the book is quite readable for those seeking awareness through an initial overview of the topics. This edited volume benefits from the contributions of industry and academic experts and helps provide a cross discipline overview of the security and practical issues for embedded systems tokens and platforms. It is an ideal complement to the earlier work Smart Cards Tokens Security and Applications from the same editors.

A Framework for Real-time 3D Reconstruction by Space Carving using

Graphics Hardware Christian Nitschke,2012-03-02 Diploma Thesis from the year 2006 in the subject Communications

Research Studies Enquiries grade 1 University of Weimar language English abstract Reconstruction of real world scenes from a set of multiple images is a topic in Computer Vision and 3D Computer Graphics with many interesting applications

There exists a powerful algorithm for shape reconstruction from arbitrary viewpoints called Space Carving. However, it is computationally expensive and hence can not be used with applications in the field of 3D video or CSCW as well as interactive 3D model creation. Attempts have been made to achieve real time framerates using PC cluster systems. While these provide enough performance, they are also expensive and less flexible. Approaches that use GPU hardware acceleration on single workstations achieve interactive framerates for novel view synthesis but do not provide an explicit volumetric representation of the whole scene. The proposed approach shows the efforts in developing a GPU hardware accelerated framework for obtaining the volumetric photo hull of a dynamic 3D scene as seen from multiple calibrated cameras. High performance is achieved by employing a shape from silhouette technique in advance to obtain a tight initial volume for Space Carving. Also, several speed up techniques are presented to increase efficiency. Since the entire processing is done on a single PC, the framework can be applied to mobile setups enabling a wide range of further applications. The approach is explained using programmable vertex and fragment processors with current hardware and compared to highly optimized CPU implementations. It is shown that the new approach can outperform the latter by more than one magnitude. The downloadable introduction has been written specifically for this offer. Its contents are only a subset of the real introductory chapter of the thesis.
