supported by numerous examples There are at least three reasons why standardizing such schemas is useful 1 When two groups are preparing to exchange information using XML documents a schema gives them a way to agree on what the structure of the documents is to be 2 Because XML schemas are machine processable and captured in a standard form tools can be built to help build XML documents automatically perhaps by extracting information from databases or to automatically generate input forms to be presented to users Similar tools can be used to automatically extract XML information into databases program APIs or spreadsheets 3 When documents are generated or received through a network validators can be used to check automatically that the rules have been followed The W3C XML Schema language allows us to document the nesting structure of the elements and attributes in valid documents It also standardizes types such as integer decimal or date that apply to the content of individual attributes or elements About the Author Mukul Gandhi has been associated with work on XML and XML Schemas since many years He was involved with the development of XML Schema 1 1 language while W3C worked on standardizing the 1 1 version of XML Schema language He has contributed to IBM s work on XML Schema 1 1 language standardization He is also the member of Apache Xerces2 XML tools project that provides among other things conformant implementations of XSD 1 0 and 1 1 processors   <u>Learning XML</u> Mem Lnc,Richard Baker,2020-09-26 xtensible Markup Language XML is used to describe data The XML standard is a flexible way to create information formats and electronically share structured data via the public Internet as well as via corporate networks XML code a formal recommendation from the World Wide Web Consortium W3C is similar to Hypertext Markup Language HTML Both XML and HTML contain markup symbols to describe page or file contents HTML code describes Web page content mainly text and graphic images only in terms of how it is to be displayed and interacted with XML data is known as self describing or self defining meaning that the structure of the data is embedded with the data thus when the data arrives there is no need to pre build the structure to store the data it is dynamically understood within the XML The XML format can be used by any individual or group of individuals or companies that want to share information in a consistent way XML is actually a simpler and easier to use subset of the Standard Generalized Markup Language SGML which is the standard to create a document structure The basic building block of an XML document is an element defined by tags An element has a beginning and an ending tag All elements in an XML document are contained in an outermost element known as the root element XML can also support nested elements or elements within elements This ability allows XML to support hierarchical structures Element names describe the content of the element and the structure describes the relationship between the elements An XML document is considered to be well formed that is able to be read and understood by an XML parser if its format complies with the XML specification if it is properly marked up and if elements are properly nested XML also supports the ability to define attributes for elements and describe characteristics of the elements in the beginning tag of an element   <u>XML for Dummies, 3rd Edition</u> Ed Tittel,Natanya Pitts-Moultis,Frank Boumphrey,2002   **XML For Dummies** ,2011
