Strings 2001 ,2002 *Strings, Branes And Extra Dimensions (Tasi 2001)* Steven S Gubser,Joseph D Lykken,2004-03-23
This book covers some recent advances in string theory and extra dimensions Intended mainly for advanced graduate students in theoretical physics it presents a rare combination of formal and phenomenological topics based on the annual lectures given at the School of the Theoretical Advanced Study Institute 2001 a traditional event that brings together graduate students in high energy physics for an intensive course of advanced learning The lecturers in the School are leaders in their fields The first lecture by E D Hoker and D Freedman is a systematic introduction to the gauge gravity correspondence focusing in particular on correlation functions in the conformal case The second by L Dolan provides an introduction to perturbative string theory including recent advances on backgrounds involving Ramond Ramond fluxes The third by S Gubser explains some of the basic facts about special holonomy and its uses in string theory and M theory The fourth by J Hewett surveys the TeV phenomenology of theories with large extra dimensions The fifth by G Kane presents the case for supersymmetry at the weak scale and some of its likely experimental consequences The sixth by A Liddle surveys recent developments in cosmology particularly with regard to recent measurements of the CMB and constraints on inflation The seventh by B Ovrut presents the basic features of heterotic M theory including constructions that contain the Standard Model The eighth by K Rajagopal explains the recent advances in understanding QCD at low temperatures and high densities in terms of color superconductivity The ninth by M Sher summarizes grand unified theories and baryogenesis including discussions of supersymmetry breaking and the Standard Model Higgs mechanism The tenth by M Spiropulu describes collider physics from a survey of current and future machines to examples of data analyses relevant to theories beyond the Standard Model The eleventh by M Strassler is an introduction to supersymmetric gauge theory focusing on Wilsonian renormalization and analogies between three and four dimensional theories The twelfth by W Taylor and B Zwiebach introduces string field theory and discusses recent advances in understanding open string tachyon condensation The thirteenth by D Waldram discusses explicit model building in heterotic M theory emphasizing the role of the E8 gauge fields The written presentation of these lectures is detailed yet straightforward and they will be of use to both students and experienced researchers in high energy theoretical physics for years to come The proceedings have been selected for coverage in Index to Scientific Technical Proceedings ISTP CDROM version ISI Proceedings CC Proceedings Engineering Physical Sciences **Strings and Geometry** Clay Mathematics Institute. Summer School,Isaac Newton Institute for Mathematical Sciences,2004 Contains selection of expository and research article by lecturers at the school Highlights current interests of researchers working at the interface between string theory and algebraic supergravity supersymmetry D branes the McKay correspondence andFourer Mukai transform *String Theory Research Progress* Ferenc N. Balogh,2008
String theory is a model of fundamental physics whose building blocks are one dimensional extended objects called strings

rather than the zero dimensional point particles that form the basis for the standard model of particle physics The phrase is often used as shorthand for Superstring theory as well as related theories such as M theory By replacing the point like particles with strings an apparently consistent quantum theory of gravity emerges Moreover it may be possible to unify the known natural forces gravitational electromagnetic weak nuclear and strong nuclear by describing them with the same set of equations Studies of string theory have revealed that it predicts higher dimensional objects called branes String theory strongly suggests the existence of ten or eleven in M theory space time dimensions as opposed to the usual four three spatial and one temporal used in relativity theory

Progress in String, Field and Particle Theory L. Baulieu, Eliezer Rabinovici, Jeff Harvey, Boris Pioline, Paul Windey, 2003-09-30 The NATO Advanced Study Institute and EC Summer School Progress in String Field and Particle Theory was held in Cargèse from June 25th till July 11th 2002 The main focus of the school was the recent progress in the very active areas of superstring theory quantum gravity and the theory of elementary particles It covered topical problems in domains such as duality between gravity and gauge interactions string field theory tachyon condensation non commutative field theory string cosmology and string phenomenology The School featured daily introductory lectures and topical seminars An informal Gong Show session allowed young post doctoral researchers and senior graduate students to make a concise presentation of their current work The School gave an excellent opportunity to the youngest researchers to establish a close relationship with their seniors and with the lecturers These proceedings will further serve in fixing the acquired knowledge and hopefully become a useful reference for anyone working in this fascinating domain of physics Some of the contributions provide an elementary introduction to their subject while other ones are more geared to the specialist We are deeply indebted to the NATO Division for Scientific Affairs for funding and for their constant attention for our meetings and to the European Commission for a High Level Scientific Conference grant HPCFCT 2001 00298
