Hands-On GPU Programming with Python and CUDA Dr. Brian Tuomanen, 2018-11-27 Build real world applications with Python 2.7, CUDA 9 and CUDA 10. We suggest the use of Python 2.7 over Python 3.x since Python 2.7 has stable support across all the libraries we use in this book. Key Features: Expand your background in GPU programming. PyCUDA, scikit-cuda and Nsight. Effectively use CUDA libraries such as cuBLAS, cuFFT and cuSolver. Apply GPU programming to modern data science applications. Book Description: *Hands On GPU Programming with Python and CUDA* hits the ground running. You'll start by learning how to apply Amdahl's Law, use a code profiler to identify bottlenecks in your Python code, and set up an appropriate GPU programming environment. You'll then see how to query the GPU's features and copy arrays of data to and from the GPU's own memory. As you make your way through the book, you'll launch code directly onto the GPU and write full-blown GPU kernels and device functions in CUDA C. You'll get to grips with profiling GPU code effectively and fully test and debug your code using Nsight IDE. Next, you'll explore some of the more well-known NVIDIA libraries such as cuFFT and cuBLAS. With a solid background in place, you will now apply your new-found knowledge to develop your very own GPU-based deep neural network from scratch. You'll then explore advanced topics such as warp shuffling, dynamic parallelism, and PTX assembly. In the final chapter, you'll see some topics and applications related to GPU programming that you may wish to pursue, including AI graphics and blockchain. By the end of this book, you will be able to apply GPU programming to problems related to data science and high performance computing. What you will learn: Launch GPU code directly from Python. Write effective and efficient GPU kernels and device functions. Use libraries such as cuFFT, cuBLAS, and cuSolver. Debug and profile your code with Nsight and Visual Profiler. Apply GPU programming to data science problems. Build a GPU-based deep neural network from scratch. Explore advanced GPU hardware features such as warp shuffling. Who this book is for: *Hands On GPU Programming with Python and CUDA* is for developers and data scientists who want to learn the basics of effective GPU programming to improve performance using Python code. You should have an understanding of first-year college or university-level engineering, mathematics, and physics, and have some experience with Python as well as in any C-based programming language such as C, C++, Go, or Java.

Programming Massively Parallel Processors Wen-mei W. Hwu, David B. Kirk, Izzat El Hajj, 2022-05-28 *Programming Massively Parallel Processors: A Hands-on Approach* shows both students and professionals alike the basic concepts of parallel programming and GPU architecture. Concise, intuitive, and practical, it is based on years of road testing in the authors' own parallel computing courses. Performance/accuracy Trade-offs of Floating-point Arithmetic on NVidia GPUs Sruthikesh Surineni, 2017 Floating point computations produce approximate results possibly leading to inaccuracy and reproducibility problems Existing work addresses two issues first the design of high precision floating point representations and second the study of methods to support a trade off between accuracy and performance of central processing unit CPU applications However a comprehensive study of trade offs between

accuracy and performance on modern graphic processing units GPUs is missing This thesis covers the use of different floating point precisions i e single and double floating point precision in the IEEE 754 standard the GNU Multiple Precision Arithmetic Library GMP and composite floating point precision on a GPU using a variety of synthetic and real world benchmark applications First we analyze the support for a single and double precision floating point arithmetic on the considered GPU architectures and we characterize the latencies of all floating point instructions on GPU Second a study is presented on the performance accuracy tradeoffs related to the use of different arithmetic precisions on addition multiplication division and natural exponential function Third an analysis is given on the combined use of different arithmetic operations on three benchmark applications characterized by different instruction mixes and arithmetic intensities As a result of this analysis a novel auto tuner was designed in order to select the arithmetic precision of a GPU program leading to a better performance and accuracy tradeoff depending on the arithmetic operations and math functions used in the program and the degree of multithreading of the code
