

PHYSICS

WHAT IS PHYSICS ALL ABOUT?

Physics seeks to understand the natural phenomena that occur in our universe; a description of a natural phenomenon uses many specific terms, definitions and mathematical equations.

Solving Problems in Physics

In physics, we use the SI units (International System) for data and calculations.

CLASSICAL MECHANICS

A. Classical or Newtonian Mechanics: The position of a body is given by an equation of motion with position, velocity and acceleration as variables; mass is the measure of the amount of matter; the standard unit for mass is kg; 1 kg = 1000 g; inertia is a property of matter, and as such, it resists space.

1. Motion along a straight line: is called rectilinear; the equation of motion describes the position of the particle and velocity for elongated time; t.

2. Velocity (v): The rate of change of the displacement (x) with time (t): $v = \frac{dx}{dt} = \frac{\Delta x}{\Delta t}$.

3. Acceleration (a): The rate of change of the velocity with time: $a = \frac{dv}{dt} = \frac{\Delta v}{\Delta t}$.

a & v are vectors, with magnitude and direction.

4. Speed: is the absolute value of the velocity, scalar with the same units as velocity.

2. Equations of Motion for One Dimension (1-D): Equations of motion describe the three position (x), velocity (v) & a body in terms of the initial velocity (v_0), position (x_0) and acceleration (a).

a. For constant acceleration, the position is related to the time and acceleration by the following equation of motion: $x(t) = x_0 + v_0 t + \frac{1}{2} a t^2$.

b. For constant acceleration, the velocity vs. time is given by the following: $v(t) = v_0 + a t$.

c. If the acceleration is a function of time, the equation must be solved using $a = a(t)$.

B. Motion in Three Dimensions (3-D)

1. For bodies moving along a straight line, derive x- and y- equations of motion:

$x = v_{0x} t + \frac{1}{2} a_x t^2$
 $y = v_{0y} t + \frac{1}{2} a_y t^2$

2. For a rotating body, use polar coordinates, an angle variable, θ , and r , a radial distance from the rotational center.

C. Motion in Three Dimensions (3-D)

1. **Cartesian System:** Equations of motion with x, y, and z components.

2. **Spherical Coordinates:** Equations of motion based on two angles (θ and ϕ) and r , the radial distance from the origin.

D. Newton's Laws of Motion

Newton's Laws are the core principles for describing the motion of classical objects in response to forces. The SI unit of force is the Newton, N ; $1N = 1kg \cdot m/s^2$; the erg unit is the dyne: $1 \text{ dyne} = 1g \cdot cm/s^2$.

| Base Quantity | Symbol | Unit |
|------------------|--------|------------------|
| Length | x, y | Meter = m |
| Mass | m, M | Kilogram = kg |
| Temperature | T | Kelvin = K |
| Time | t | Second = s |
| Electric Current | I | Ampere = A (C/s) |

Other physical quantities are derived from these basic units. Prefixes denote fractions or multiples of units; many variable symbols are Greek letters.

Math Skills: Many physical concepts are only understood with the use of algebra, statistics, trigonometry, and calculus.

1. Newton's 1st Law: A body remains at rest or in motion unless influenced by a force.

2. Newton's 2nd Law: Force and acceleration determine the motion of a body and predict future position and velocity: $F = m a$ OR $\Sigma F = m a$.

3. Newton's 3rd Law: Every action is countered by an opposing action.

E. Types of Forces

1. **Body Force:** acts on the entire body, with the force acting at the center of mass.

a. A gravitational force, F_g , pulls an object toward the center of the Earth: $F_g = mg$.

b. Weight = F_g ; gravitational force.

c. Mass is a measure of the quantity of material, independent of g and other forces.

2. **Surface Forces:** act on the body's surface.

a. **Friction:** F_f , is proportional to the force normal to the part of the body in contact with a surface: $F_f = \mu F_n$.

i. **Static friction:** resists the movement of a body.

ii. **Dynamic friction:** slows the motion of a body.

For an object on a horizontal plane: $F_f = \mu F_n = \mu mg$.

Net force = $F_n - F_f$.

F. Circular Motion

1. Motion along a circular path uses polar coordinates: (r, θ) .

2. Key Variables:

| | | |
|----------|----------------------------|--|
| r | Meter | The distance from the rotation center (center of mass) |
| θ | Radian | The angle between r and the $0x$ axis. |
| ω | Radian/second | The angular velocity |
| α | Radian/second ² | The angular acceleration |

3. Tangential acceleration α_t velocity:

$v_t = r \omega \alpha_t = r \omega \alpha$; v and α along the path of the motion are.

4. Centripetal acceleration: $a_c = \frac{v^2}{r}$; a is directed toward the rotational center.

a. The centripetal force keeps the body in circular motion with a tangential acceleration and velocity.

G. Kinetic Energy & Work

1. **Kinetic energy:** KE Kinetic energy is the energy of motion; mass, m and velocity, v: $K = \frac{1}{2} m v^2$. The SI energy unit is the Joule (J): $1J = 1 \text{ kg} \cdot m^2/s^2$.

2. **Momentum:** mv Momentum is a property of motion, defined as the product of mass and velocity: $p = m v$.

3. **Work (W):** Work is a force acting on a body moving a distance; $w = \int F \cdot ds$.

For a constant force, work is the scalar product of the two vectors: force, F , and path, s : $W = F \cdot \text{dis} \cdot \cos(\theta) = F \cdot r \cdot v$.

Work = $\int F(t) \cdot ds$

The SI unit for power is the Watt (W): $1W = 1 \text{ Joule/second} = 1 \text{ J/s}$.

Work for a constant output of power: $W = P \cdot t$

H. Potential Energy & Energy Conservation

1. The total energy of a body, E, is the sum of kinetic, K , & potential energy, U : $E = K + \sum U$.

2. Potential energy arises from the interaction with a potential from an external force.

Potential energy is energy of position: $U(r)$; the form of U depends on the force generating the potential: Gravitation: $U(r) = -\frac{G m}{r}$.

Electricity: $U(r) = \frac{q_1 q_2}{4\pi \epsilon_0 r}$.

If there are no other forces acting on the system, E is constant and the system is called conservative.

I. Collisions & Linear Momentum

1. **Types of Collisions:**

a. Elastic: conserve energy

b. Inelastic: energy is lost as heat or deformation.

2. **Relativistic Motion & Frames of Reference:** A body moves with velocity v in frame S; in frame S' the velocity is v' ; if V_s is the velocity of frame S' relative to S, therefore: $v' = v_s + v$.

3. **Classic Collision:**

Conservative Kinetic Energy: $\sum (1/2 m v_i^2) = \sum (1/2 m v_f^2)$

Conservative Momentum: $\sum m v_i = \sum m v_f$

4. **Impulse:** is a force acting over time.

Impulse = $F \cdot \Delta t$ or $\int F(t) \cdot dt$.

Impulse is also the momentum change: $p_f - p_i$.
