given Not all of those approaches are up to today's standard of providing valid and reliable measures Hence in Chapter 3 only the promising subset of those approaches is further analyzed Those methods are critically analyzed and assessed with the help of the existing literature Building on this a holistic customer satisfaction measurement system is introduced Subsequently Chapter 4 addresses the issue of comparability of different customer satisfaction measures and represents the transition from the theoretical to a praxis based empirical part Chapter 4.1 focuses on challenges for obtaining comparable data in international measurements A closer look is taken at the different national CSI models as well as a recently established uniform European approach Furthermore study results of individual countries and industries are examined for their similarities and differences The thesis concludes with a summary of the most important findings and provides an outlook on future developments in the field of customer satisfaction research

Customer Satisfaction Measurement on the Internet Katja Hofmaier, 1999-06-09 Inhaltsangabe Abstract Based on the Expectancy Disconfirmation Model as the underlying construct

methods to measure customer satisfaction with products and the steps to be undertaken in the research process are investigated. The measurement of Derived Satisfaction using disconfirmation was found to be the appropriate approach to CS measurement. The Critical Incidents Technique can be used to assess the influence of exceptional experiences and the customers' evaluation of value added services. The method of Focus Group interviewing is most appropriate for the exploration of important product attributes with customers while In Depth Interviews structure salespeople and executive interviews. It was also shown that during the research process several points specific to CS measurements need to be accounted for. The Internet services currently used by marketing and social researchers include E mail mailinglists, newsgroups, Internet Chat, the World Wide Web (WWW) and Virtual Worlds. Virtual Worlds being most advantageous for observational studies are not useful for customer satisfaction research. Virtual Communities in turn have some promising characteristics for future use. Internet research methods based on these services include E mail surveys, WWW surveys and online Focus Groups. Common advantages of E mail and WWW surveys include administrative and response speed, cost savings and global reach of respondents. Their greatest common disadvantage is the non representativeness of the respondents for the larger population as well as their self selection. Unless access is restricted to a known population, probability sampling is impossible when using the World Wide Web. Because of its serious disadvantages, the use of online Focus Groups is not yet advisable. Based on these insights, the Internet was found to be an advantageous medium for customer satisfaction studies only if specific conditions are met. Companies need to investigate on a case by case basis if the online measurement of customer satisfaction is possible in their specific situation. The recommendations that were made are summarized in the online research process and the decision making framework. The results of a survey among market research agencies show that practitioners are to a large extent aware of the limitations within which the Internet can be used for customer satisfaction surveys. However, especially WWW surveys sometimes are conducted in a way that does
