Renewable Energy Transition with Artificial Intelligence Nina Dethlefs, Joyjit Chatterjee, 2026-01-28 Explores harnessing AI to overcome strategic and operational challenges in renewable energy transition. The urgent need to decarbonize global energy systems has propelled renewable energy into a position of unprecedented importance yet this shift presents major technical, economic and policy challenges. Increasing reliance on intermittent energy sources such as solar and wind demands more effective forecasting, grid coordination and flexibility. Artificial Intelligence AI offers powerful tools to meet these challenges by learning from data, modeling complex interactions and enabling real time optimization across generation, transmission and consumption. Renewable Energy Transition with Artificial Intelligence: Challenge driven Solutions highlights successful pathways of knowledge transfer between academia and industry through case studies drawn from wind, solar and emerging energy sources. Focusing on challenge driven problem solving, the authors showcase transferable strategies that overcome pressing obstacles such as the lack of open datasets, the reluctance to adopt opaque predictive models and insufficient performance benchmarks. Contributions by leading experts emphasize explainable AI, collaborative innovation and the vital role of shared infrastructures for data and knowledge exchange. The book also draws from the authors' international workshop with diverse stakeholders, underscoring the importance of cross sector cooperation in ensuring sustainable and scalable impact. Adopting a challenge driven framework linking AI innovation with renewable energy adoption, this title integrates perspectives from academia, industry and the public sector to identify scalable solutions. Demonstrates methods for bridging the black box problem in neural network based energy forecasting. Addresses data scarcity by proposing solutions for open access standardization and benchmarking in renewables. AI Provides practical insights for distributed generation, storage and demand response management. Explores future directions for explainable AI in energy system integration and resilience. Both a roadmap and a reference point for integrating AI into renewable systems to accelerate global decarbonization, this book is designed for advanced students, researchers and practitioners in engineering, computer science and renewable energy. It is suitable for courses such as Renewable Energy Systems, Artificial Intelligence Applications in Engineering and Energy Policy and Technology within graduate and postgraduate degree programs in engineering, data science and environmental studies.
