The Austin Protocol Compiler The Austin Protocol Compiler:

The Austin Protocol Compiler Tommy M. McGuire, Mohamed G. Gouda, 2004-11-19 There are two groups of researchers who are interested in designing network protocols and who cannot yet effectively communicate with one another concerning these protocols The first is the group of protocol verifiers and the second is the group of protocol implementors The main reason for the lack of effective communication between these two groups is that these groups use languages with quite different semantics to specify network protocols On one hand the protocol verifiers use specification languages whose semantics are abstract coarse grained and with large atom ity Clearly protocol specifications that are developed based on such semantics are easier to prove correct On the other hand the protocol implementors use specification languages whose semantics are concrete fine grained and with small atomicity Protocol specifications that are developed based on such mantics are easier to implement using system programming languages such as C C and Java To help in closing this communication gap between the group of protocol verifiers and the group of protocol implementors we present in this monograph a protocol specification language called the Timed Abstract Protocol or TAP for short notation This notation is greatly influenced by the Abstract Protocol Notation in the textbook Elements of Network Protocol Design written by the second author Mohamed G Gouda The TAP notation has two types of sem tics an abstract semantics that appeals to the protocol verifiers and a concrete semantics thatappeals to the protocol implementors group *Formal Languages and Computation* Alexander Meduna, 2014-02-11 Formal Languages and Computation Models and Their Applications gives a clear comprehensive introduction to formal language theory and its applications in computer science It covers all rudimental topics concerning formal languages and their models especially grammars and automata and sketches the basic ideas underlying the theory of computation including computability decidability and computational complexity Emphasizing the relationship between theory and application the book describes many real world applications including computer science engineering techniques for language processing and their implementation Covers the theory of formal languages and their models including all essential concepts and properties Explains how language models underlie language processors Pays a special attention to programming language analyzers such as scanners and parsers based on four language models regular expressions finite automata context free grammars and pushdown automata Discusses the mathematical notion of a Turing machine as a universally accepted formalization of the intuitive notion of a procedure Reviews the general theory of computation particularly computability and decidability Considers problem deciding algorithms in terms of their computational complexity measured according to time and space requirements Points out that some problems are decidable in principle but they are in fact intractable problems for absurdly high computational requirements of the algorithms that decide them In short this book represents a theoretically oriented treatment of formal languages and their models with a focus on their applications It introduces all formalisms concerning them with enough rigors to make all results quite clear

and valid Every complicated mathematical passage is preceded by its intuitive explanation so that even the most complex parts of the book are easy to grasp After studying this book both student and professional should be able to understand the fundamental theory of formal languages and computation write language processors and confidently follow most advanced books on the subject
