Modern Financial Engineering: Counterparty, Credit, Portfolio And Systemic Risks Giuseppe Orlando,Michele Bufalo, Henry Penikas, Concetta Zurlo, 2021-12-28 The book offers an overview of credit risk modeling and management A three step approach is adopted with the contents after introducing the essential concepts of both mathematics and finance Initially the focus is on the modeling of credit risk parameters mainly at the level of individual debtor and transaction after which the book delves into counterparty credit risk thus providing the link between credit and market risks The second part is aimed at the portfolio level when multiple loans are pooled and default correlation becomes an important factor to consider and model In this respect the book explains how copulas help in modeling The final stage is the macro perspective when the combination of credit risks related to financial institutions produces systemic risk and affects overall financial stability The entire approach is two dimensional as well First all modeling steps have replicable programming codes both in R and Matlab In this way the reader can experience the impact of changing the default probabilities of a given borrower or the weights of a sector Second at each stage the book discusses the regulatory environment This is because at times regulation can have stricter constraints than the outcome of internal models In summary the book guides the reader in modeling and managing credit risk by providing both the theoretical framework and the empirical tools necessary for a modern finance professional In this sense the book is aimed at a wide audience in all fields of study from quants who want to engage in finance to economists who want to learn about coding and modern financial engineering
