What do the blue whale and great white shark have in common?

Both these creatures live in the water, have dorsal fins, and streamlined bodies, but in reality, they're as different from one another as Maya and the shark.

The blue whale breathes through lungs and has a skeleton of bones whereas the great white shark breathes through gills and has cartilage instead of bones.

Thus, a blue whale is a mammal like Maya and not a fish like the great white shark.

In this manner, scientists group organisms into different categories after researching their similarities and differences. This system of grouping is called taxonomic classification.

Trying to find a specific organism among the two million discovered organisms on Earth can become a laborious task for a scientist. Complicating things further is the fact that a single species is often known by different names in different countries.

Taxonomic classification also helps scientists name organisms. These names are very specific for each organism and help to avoid confusion.

Early scientists divided the living world into two groups—plants and animals—based on one major characteristic: how they obtain nutrition.
