Real-time Forecasting for Renewable Energy Development United States. Congress. House. Committee on Science and Technology (2007). Subcommittee on Energy and Environment, 2010 A significant barrier to the widespread adoption of many forms of renewable energy including wind solar and marine and hydrokinetic power is that these sources are intermittent Electric grid managers address this intermittency by adjusting the delivery of other sources of power based on expected changes in renewable power output These expected changes are called power production forecasts Such forecasts must take into account changing weather conditions in conjunction with the land s topography near a renewable energy device along with the device s expected technical performance Several recent reports have determined that improving the accuracy and frequency of these forecasts can have a major impact on the economic viability of renewable energy resources This hearing provides testimony on the roles that various Federal agencies as well as the private sector play in providing forecasting data and services relevant to expanding the availability of reliable renewable power and the extent to which these efforts are coordinated The hearing will also explore any research development demonstration and monitoring needs that are not currently being adequately addressed P 3 4
