

## The Molecular Basis of Heredity

The **central dogma** of molecular biology is that information is transferred from DNA to RNA to protein, in a process called **gene expression**.

One of the most interesting discoveries of molecular biology is the near-universal nature of the genetic code.

Although some organisms show slight variations in the amino acids assigned to particular codons, the code is always read three bases at a time and in the same direction.

Despite their enormous diversity in form and function, living organisms display remarkable unity at life's most basic level, the molecular biology of the gene.
