circuit does not include air correction and on 32: DFE and 32:DIFM types the circuit emerges directly above the secondary nozzle.

DPV, DPAV, DGV and DGAV carburetors are also equipped with a full power valve which operates immediately the primary throttle valve is opened quickly. Under these conditions the vacuum through channel (7) is insufficient to draw the diaphragm (4) against the spring (5) and the operating rod (6) therefore opens the full power valve (12). The fuel level in the primary emission tube well (14) immediately rises and the mixture drawn from the nozzle (21) is enriched. When the

primary shuttle valve is partially open, the vacuum through channel 171 overcomes the tension of the spring 601 and the full primary valve shuts.

ACKNOWLEDGMENT

To provide the engine with a rich mixture when accelerating, the carburetor is provided with a diaphragm type acceleration pump which is operated by the primary throttle shaft and injects only into the primary venturi. Reference to Fig. 7-7 will show that when the primary throttle valve is closed, the accelerator pump diaphragm (48) draws fuel from the float
