

## WK 7 : Overview of the digestive system

### Functions of the Gastrointestinal system

- Food is broken down (via **mechanical/chemical digestion**) into its smallest components and absorbed into the blood
- Ingested nutrients, vitamins and minerals are used to:
  - produce energy
  - drive metabolic processes
  - synthesize hormones
- Has a critical role in **fluid, electrolyte, and acid-base homeostasis** by taking in water and electrolytes via the diet (water in = water out)
- Excretion of metabolic wastes in faeces

### Organs of the GI SYSTEM

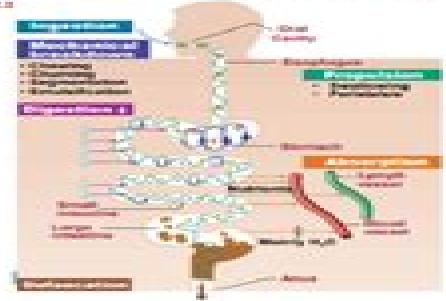

- Digestive system
  - set of organs that breaks down food items into **nutrients that can be delivered by bloodstream to cells in body**
  - Organs located from head to abdominopelvic cavity
  - Ingested nutrients, vitamins and minerals are used to **produce energy (ATP), drive metabolic processes, and synthesize hormones**
  - The digestive system consists of two types of organs: organs of gastrointestinal (GI) tract (also known as the alimentary canal) and accessory organs**
- Organs of GI tract
  - A continuous tube through which food passes. Starts at the oral cavity and ends at the rectum
- Accessory organs
  - Assist in digestion in some way, but are **not part of the GI tract**, and typically don't come in direct contact with food

Figure 22.1

### Basic Digestive Processes

- Mastication** – chewing starts the mechanical breakdown of food (teeth/tongue)
- Ingestion/Propulsion** – swallowing, peristalsis and segmentation
- Secretions** – from endocrine and exocrine organs aid digestive processes
- Mechanical Digestion** – food is physically broken down using movement
- Chemical Digestion** – food (bonds) is chemically broken down using enzymes
- Absorption** – transfer of nutrients from the gut to the blood circulation
- Defaecation** – expulsion of undigested material and waste products

### Tissues of the GI tract

- Digestive organs of GI tract follow **same general tissue pattern**
