

Step-wise Guide to SSI Practices

1. Bud selection

In SSI method, single budded chips from the healthy mother canes are used for raising nurseries. The procedure given below has to be followed for the selection of healthy buds.

- Select healthy canes of 7 to 9 months old which have good internode length (7 to 8 inches) and girth.
- Observe and avoid canes with obvious infestation like fungus growth, spots etc.
- Cut the required quantity of canes (refer table 2). Farmers who are unable to go for immediate chipping of buds may keep the cut canes for about a week under shade.
- Remove buds from the selected canes using an implement called Bud Chipper (as shown in the picture). The Bud Chipper comprises a handle and a cutting blade fixed on a wooden plank.
- Keep the cane on the plank and adjust it in such a way that a single bud is placed exactly below the cutting blade. When the handle is pressed, single bud chip comes off the cane.
- Large number of buds (about 150/hr) can easily be chipped off in this way in a short period of time.
- Next, the chipped buds have to be treated with organic or chemical solutions.

While selecting buds, avoid taking buds from submerger top and 3-4 short internodes at bottom.

Take care to cut the chip with healthy bud placed at the center.

Damaged, split and sprouted buds are to be avoided when chipping.

Table 2. Details of canes required for 1 acre

Age of the cane	No. of potential buds per cane	No. of canes required
7-9 months	50-12	450-500
