1999 the ACM published a study that presented a comparison of 40 independent implementations of a computationally intensive problem created by different programmers in either Java the then current managed runtime environment or C C It concluded with the finding that interpersonal differences between the developers are much larger than the average difference between Java and C C and that performance ratios of a factor of 30 or more are not uncommon between the median programs from the upper half versus the lower half This should teach you something If you are not a guru level C programmer then the chance is quite high that a managed code implementation performs as well as the average C solution especially given the fact that most .NET languages simply allow you fewer possibilities to introduce subtle memory related or performance related issues And keep in mind that this study was conducted several years ago and that Just In Time Compilation JIT as well as memory management and garbage collection GC technologies have been improved in the meantime This however doesn't mean that you can't create horribly slow memory eating applications with .NET That's why you should be really concerned about the other part of the study's conclusion namely that interpersonal differences are much larger In essence this means that you have to know about how to optimize your applications so that they run with the expected performance in a managed environment Even though .NET frees you from a lot of tasks that in C would have been your responsibility as a developer these tasks still exist these little puppets have only cleared the main stage and now live in some little corner behind the scenes If you want your application to run in the top performance range you will still need to find the right strings to pull to move these hidden figures and to basically keep them out of the way of negatively affecting your application's performance Lutz Prechtelt Comparing Java vs C C Efficiency Differences to Interpersonal Differences Communications of the ACM 42 no 10 October 1999 109 112 But knowing about the common language runtime's internals is still not enough as lots of performance issues actually turn up during application design and not just during the coding stage Collections remoting interoperability with unmanaged code and COM components are not the only things that come to my mind in this regard It is the aim of Nick's book to enable you to understand the design issues as well as the underlying CLR mechanisms in order to create the programs that run on the better side of the 30 times performance difference quoted in the ACM study Nick really managed to create a book that addresses these issues which will otherwise turn up when carelessly coding to a managed environment This book will allow you to get into the details without being overwhelmed by the underlying complexity of the common language runtime The only thing you have to resist after reading the book is the urge to over optimize your code I was delighted to see that Nick begins with a discussion of identifying an application's performance critical sections and only later turns towards isolating and resolving these real performance bottlenecks This is in my opinion one of the most important tasks and also one of the most complex ones when working with large scale applications And now read on and enjoy the ride to the better side of a 30 fold performance difference Ingo Rammer author of Advanced .NET Remoting Vienna Austria <http://www.ingorammer.com> About the Book Maximizing .NET Performance is the
