Foundations of Python Network Programming John Goerzen,Tim Bower,Brandon Rhodes,2011-02-24 This second edition of Foundations of Python Network Programming targets Python 2.5 through Python 2.7 the most popular production versions of the language Python has made great strides since Apress released the first edition of this book back in the days of Python 2.3 The advances required new chapters to be written from the ground up and others to be extensively

revised You will learn fundamentals like IP TCP DNS and SSL by using working Python programs you will also be able to familiarize yourself with infrastructure components like memcached and message queues You can also delve into network server designs and compare threaded approaches with asynchronous event based solutions But the biggest change is this edition's expanded treatment of the web The HTTP protocol is covered in extensive detail with each feature accompanied by sample Python code You can use your HTTP protocol expertise by studying an entire chapter on screen scraping and you can then test lxml and BeautifulSoup against a real world web site The chapter on web application programming now covers both the WSGI standard for component interoperability as well as modern web frameworks like Django Finally all of the old favorites from the first edition are back E mail protocols like SMTP POP and IMAP get full treatment as does XML RPC You can still learn how to code Python network programs using the Telnet and FTP protocols but you are likely to appreciate the power of more modern alternatives like the paramiko SSH2 library If you are a Python programmer who needs to learn the network this is the book that you want by your side

Photovoltaic Pumping Systems for Domestic Sustainable Water

Access in Off-Grid Areas Judith Alazraque Cherni, Simon Meunier, Loïc Quéval, 2024-03-23 This book offers practical guidance for practitioner engineers, policymakers, and other decision makers on how to implement solar photovoltaic water pumping systems to provide domestic clean water in off-grid regions of developing countries. By championing genuine multidisciplinary research and generating interdisciplinary results, this book develops models and approaches which indicate how it might be possible to overcome some of the limitations that technocratic approaches to renewable energy and water access pose to truly sustainable development. The book addresses technical challenges often found when promoting photovoltaic water pumping systems. It offers practical guidance to stakeholders on how to successfully select, install, and maintain photovoltaic water pumps to promote sustainable options for the poorest underserved areas/populations. A main novelty of this book is that by using theoretical as well as real actual field work data and advanced modelling, it successfully connects energy systems engineering, environmental and geographical information and hydrology with population surveys which reveal local needs and conditions. The book is timely and important. More than 665 700 million worldwide still do not have access to improved drinking water sources; eight out of ten live in rural areas typically located either in off-grid territory or where connection to nearby grid is too expensive or unfeasible. Unsafe water is responsible for 1.2 million deaths each year, mainly correlated with the diarrheal diseases generated from drinking water from unimproved water sources.

Sustainable Development Goal 6: clean water and sanitation may be achieved only if water is accessible to everyone, available when needed and free from contamination
